

ICIMOD

Remote Sensing Concepts and Applications

Rajesh Bahadur Thapa, PhD

Remote Sensing & Geoinformation Specialist

Rajesh.Thapa@icimod.org

<https://www.icimod.org/team/rajesh-bahadur-thapa/>

BIO Presenter

Dr. Thapa works at ICIMOD and leads the Group on Land Use Land Cover Change and Ecosystem Services, Geospatial Solutions and the Capacity Development Programme of SERVIR-HKH (NASA-USAID) Initiative, MENRIS Regional Programme. His researches focus on monitoring and assessment of terrestrial environments including forest, agriculture, urban, and disaster thematic areas. He empowers people to use emerging Earth observation and geospatial technologies for making evidence-based decisions to protect the pulse of the planet.

He is an active member of Group on Earth Observations (GEO) Capacity Development Working Group and has 25+ years of work experience across various Asian countries including Japan, Thailand, and the HKH region. Prior to joining ICIMOD, he served at the Japan Aerospace Exploration Agency (JAXA). He was also a visiting professor at the University of Tsukuba, Japan. He holds a PhD in Geoenvironmental Science, MSc in Remote Sensing and GIS, and Master Degree in Geography. Recently, SERVIR Global recognized his remarkable contributions and unwavering commitment to capacity development for connecting space to village mission and awarded prestigious SERVIR Award of Excellence 2019.

Remote Sensing Concepts

CONNECTING SPACE TO VILLAGE

WHAT IS SERVIR?
SERVIR provides space for digital technology strengthening livelihoods via satellite data to address challenges in food security, water resources, weather and climate, land use, and natural disasters. SERVIR provides technical assistance to improve livelihoods and resilience and supports in India, Africa, and the Americas.

SERVIR HINDU KUSH HIMALAYA
Since 2008, SERVIR has been working in the Hindu Kush Himalayas (HKH) region, the international border for Integrated Mountain Development (IMD) implemented by SERVIR under the leadership of ICIMOD. SERVIR is collaborating with the regional weather, monitoring, and forecasting center in Afghanistan, Bangladesh, Bhutan, Nepal, and Pakistan.

LAND USE, LAND COVER CHANGE AND ECOSYSTEMS
SERVIR data is monitoring forest land cover and deforestation and helps in assessing climate change vulnerability and adaptation planning for forest communities in India.

WEATHER AND CLIMATE SERVICES
Working closely with partner institutions, SERVIR data is supporting the high impact Weather Resilient Trade (WRT) to benefit weather-vulnerable small farmers in the Hindu Kush Himalayas.

AGRICULTURE AND FOOD SECURITY
SERVIR data is developing an regional drought monitoring and early warning system to support agriculture address problems in Afghanistan, Bangladesh, Nepal, and Pakistan. WRT data is also used to support in assessing food security and resilience in mountainous regions in the Hindu Kush Himalayas.

WATER RESOURCES AND HYDRO-CLIMATIC DISASTERS
SERVIR data is assisting in enhancing flood early warning in mountainous regions in the Hindu Kush Himalayas.

A SERVICE APPROACH
SERVIR offers the user a service for the assessment of risk, identification of priority areas, and an advisory solution that can address local, state, national, and global challenges. The service is provided through a user-friendly, decision support system, tools, data, reports, and advisory training activities.

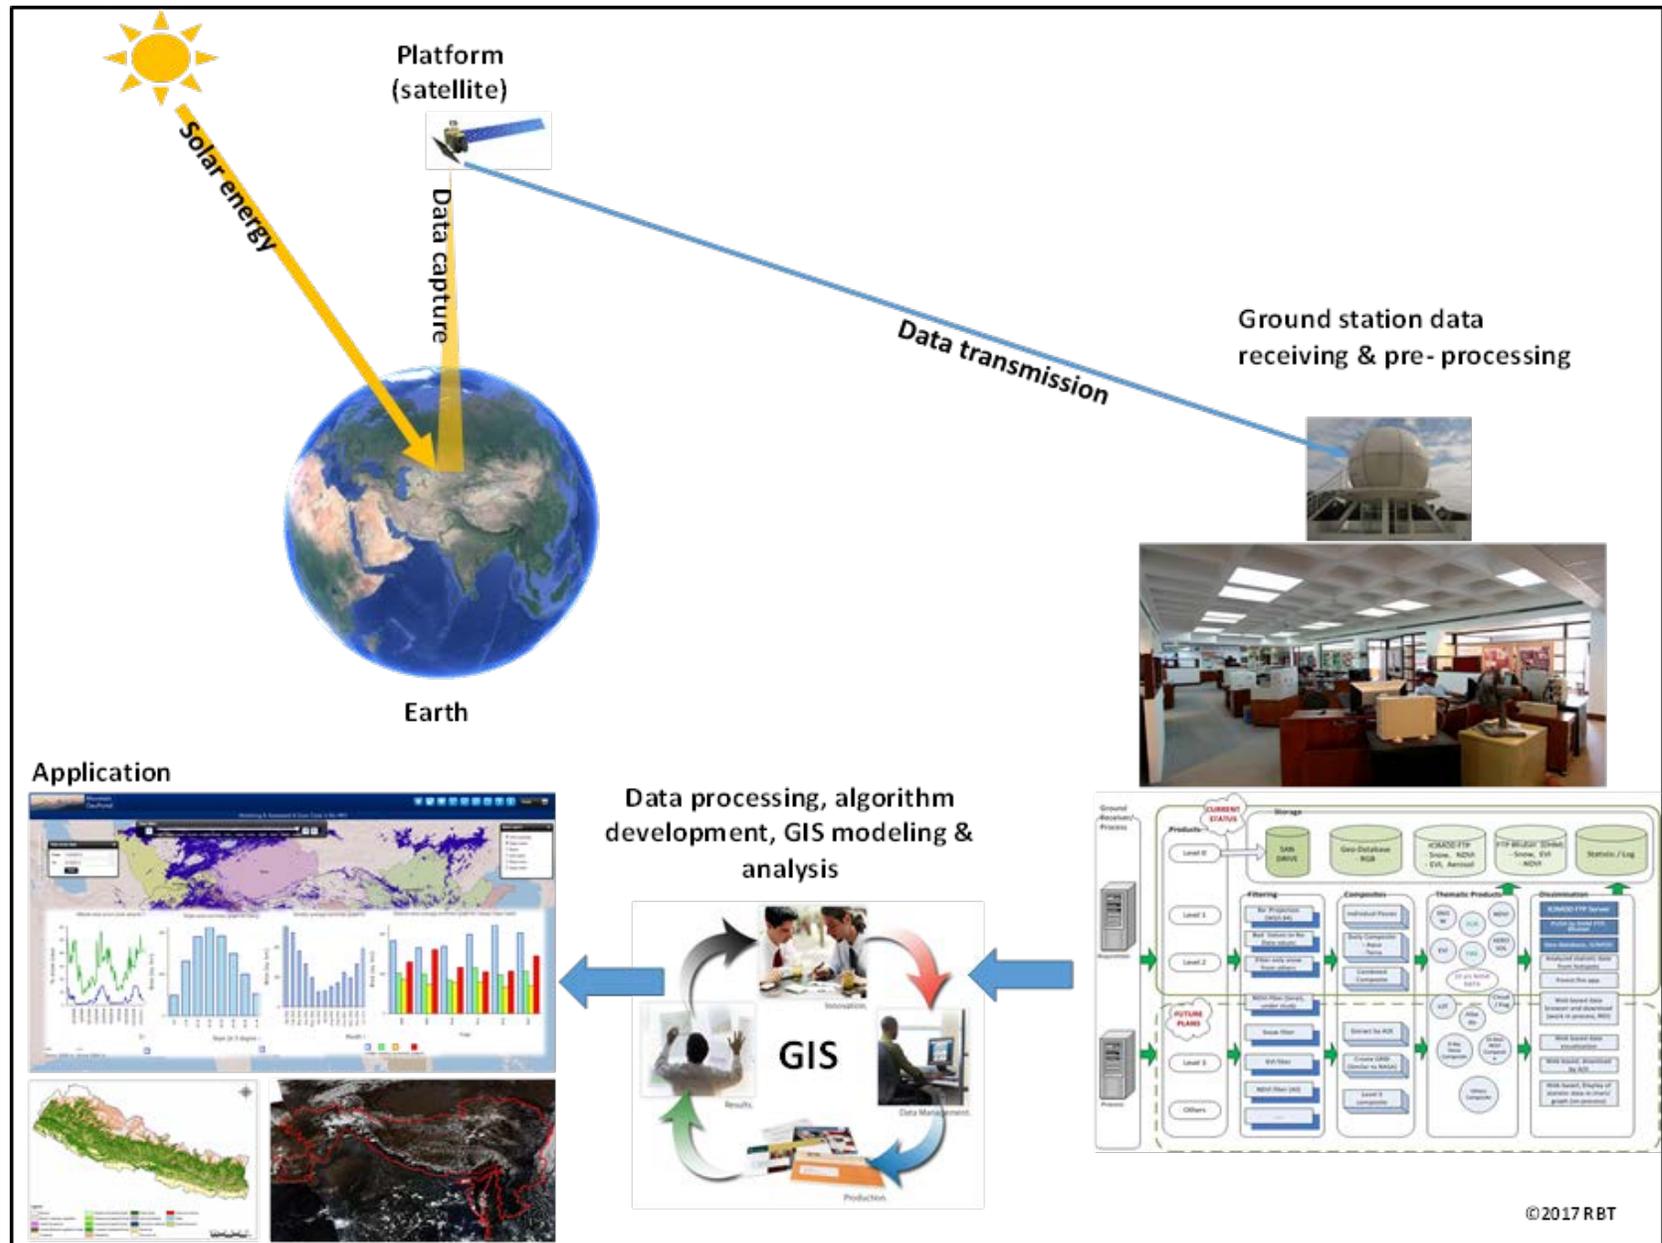

LEVERAGING PARTNERSHIPS
SERVIR data engages efforts to enhance the design, development, and implementation of the user-friendly, decision support system, tools, data, reports, and advisory training activities.

ENHANCING INSTITUTIONAL CAPACITIES
Capacity building activities help strengthen the technical, operational, and managerial capabilities of the user-friendly, decision support system, tools, data, reports, and advisory training activities.

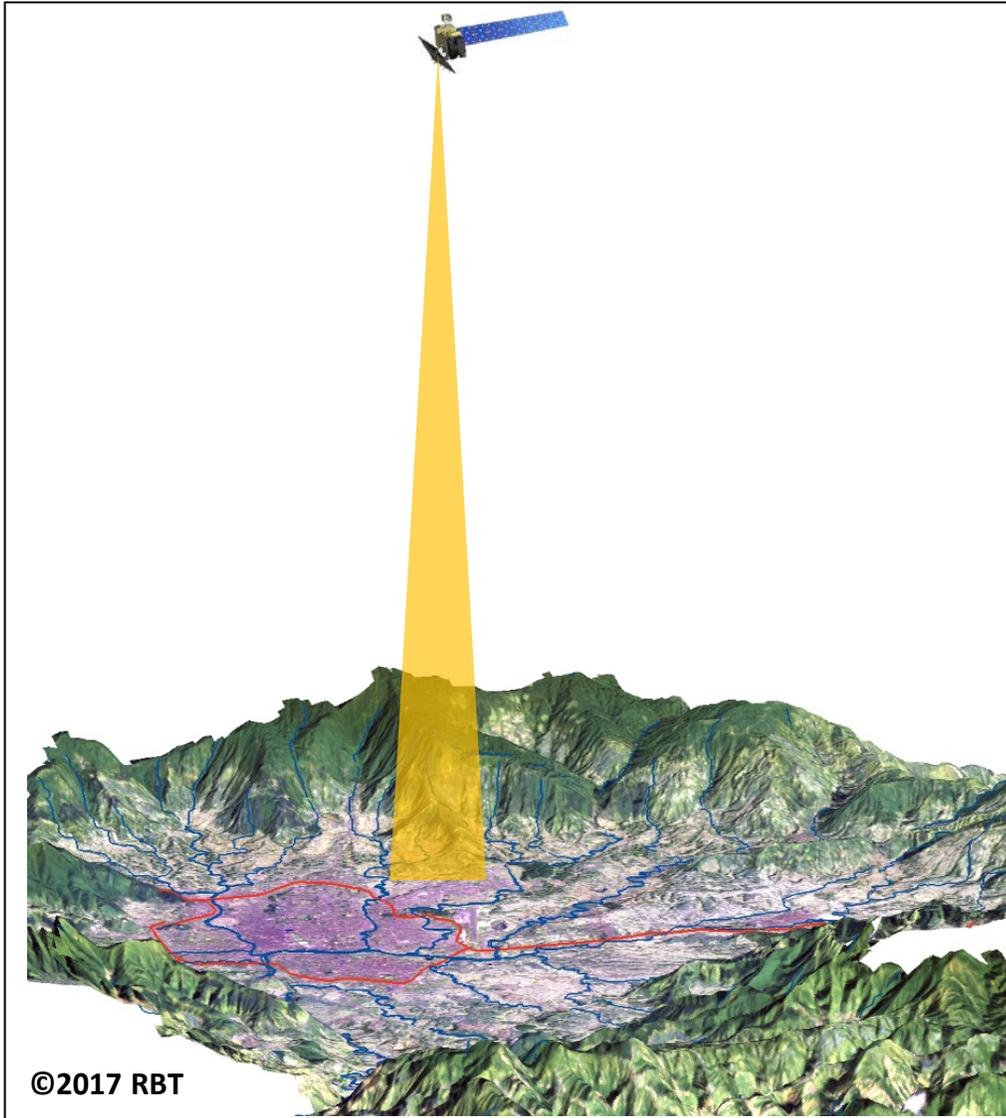

INTEGRATING GENDER AND YOUTH
SERVIR data supports the integration of gender and youth in the design, development, and implementation of the user-friendly, decision support system, tools, data, reports, and advisory training activities.

Remote Sensing Concepts

- Remote sensing is the science for collecting and interpreting information on targets (objects or areas) without being in physical contact with them.
- It employs electromagnetic energy in the form of radio waves, light, and heat as a means of detecting and measuring target characteristics.
- Remote sensing gathers information about the Earth from a distance, usually from aircraft or satellites

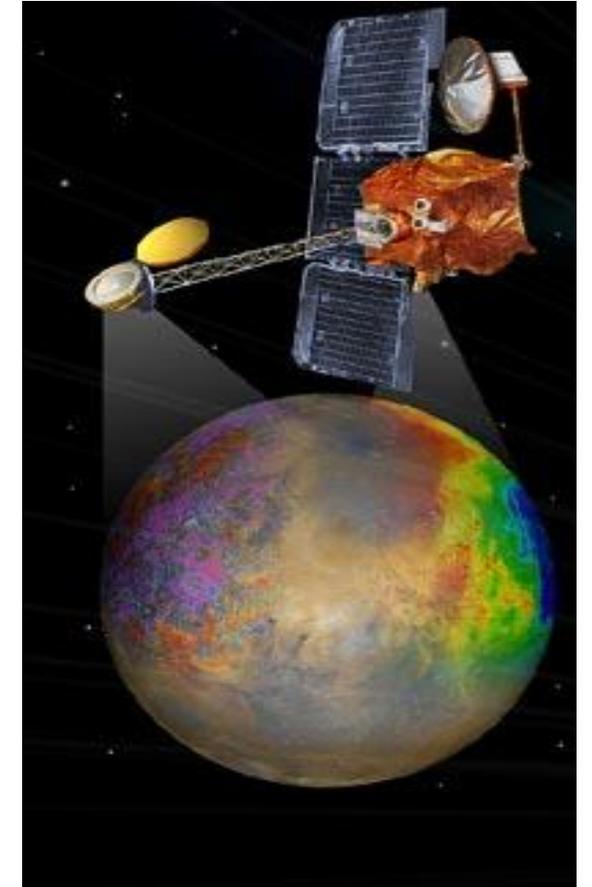

Remote Sensing Platforms

Ground-based

Aerial-based

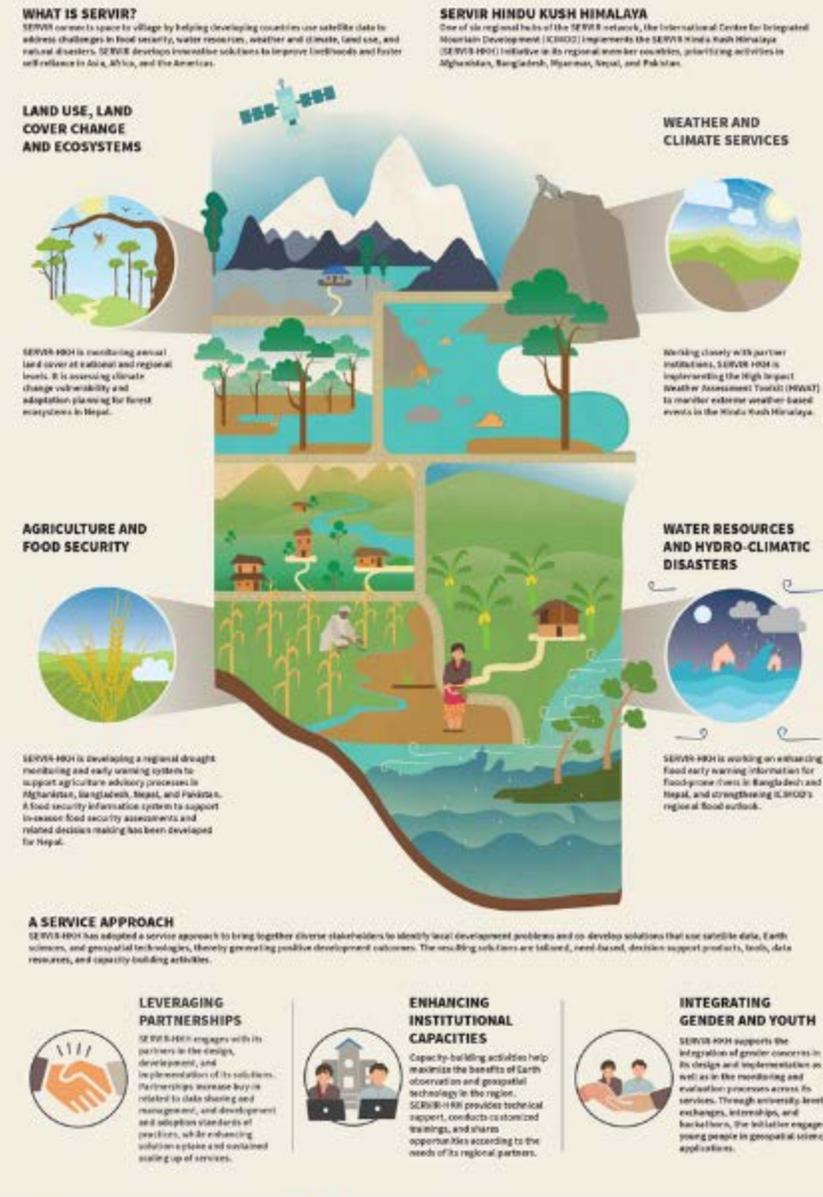

Satellite-based

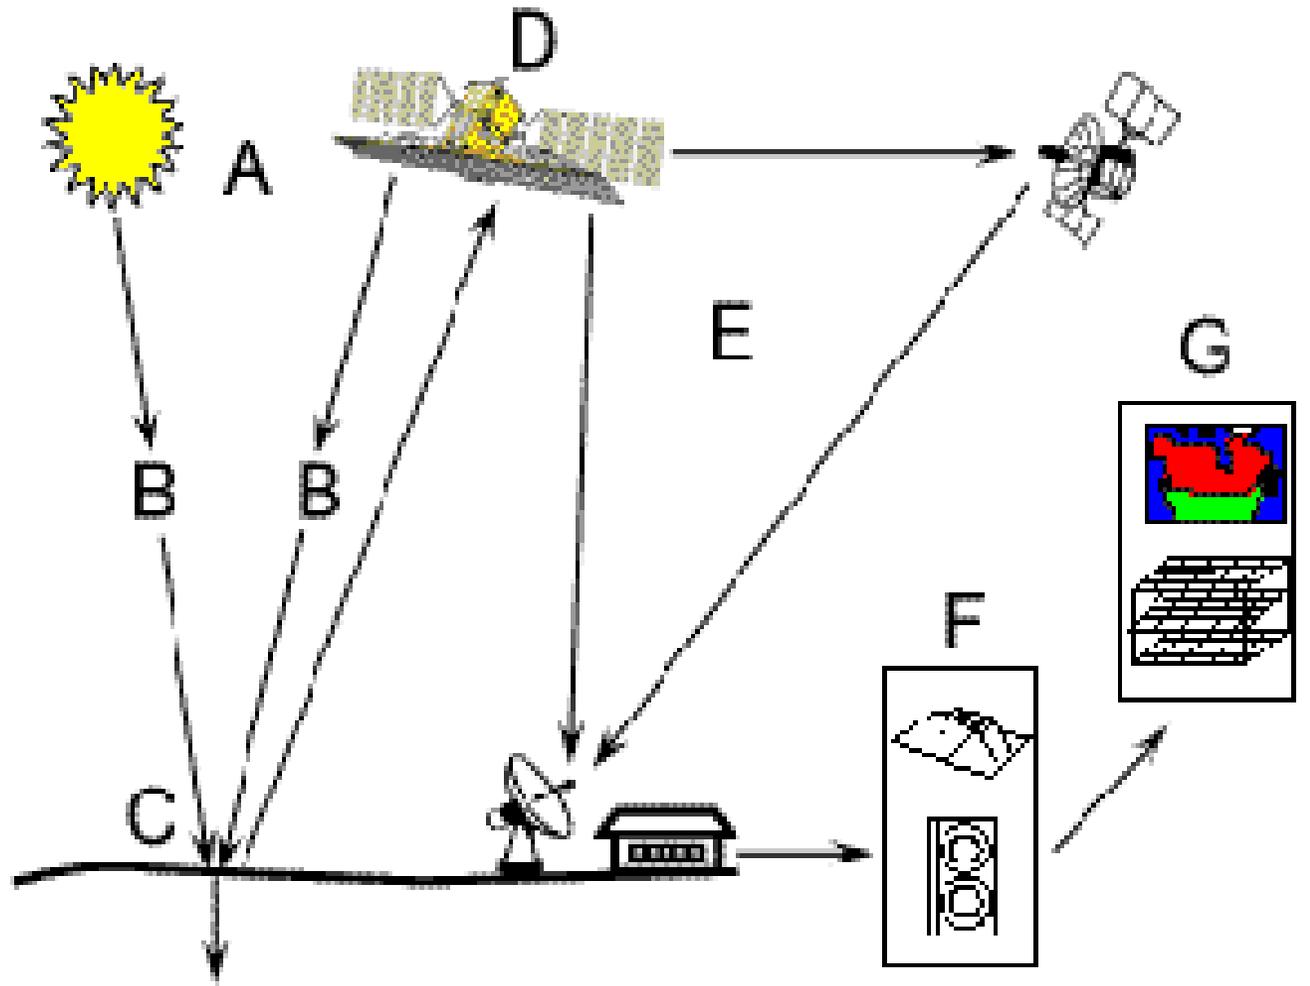

Components of Remote Sensing

- **Energy source:** Sun, irradiance from earth's materials which is used in passive remote sensing; RADAR, irradiance from artificially-generated energy sources, which is used in active remote sensing)
- **Platforms:** The vehicle which carries a sensor, i.e., balloon, aircraft, space shuttle, satellite, international space station, etc.
- **Sensors:** Device that receives electromagnetic radiation and converts it into a signal that can be recorded and displayed as either numerical data or an image (camera, scanner, radar, etc.).
- **Processing:** Handling remotely sensed signal data, i.e., photographic, digital, etc.
- **Institutionalization:** Organization for executing at all stages of remote-sensing technology to connect space to village.

- D. Recording of energy by the sensor
- E. Transmission, reception, and processing
- F. Interpretation and analysis
- G. Applications

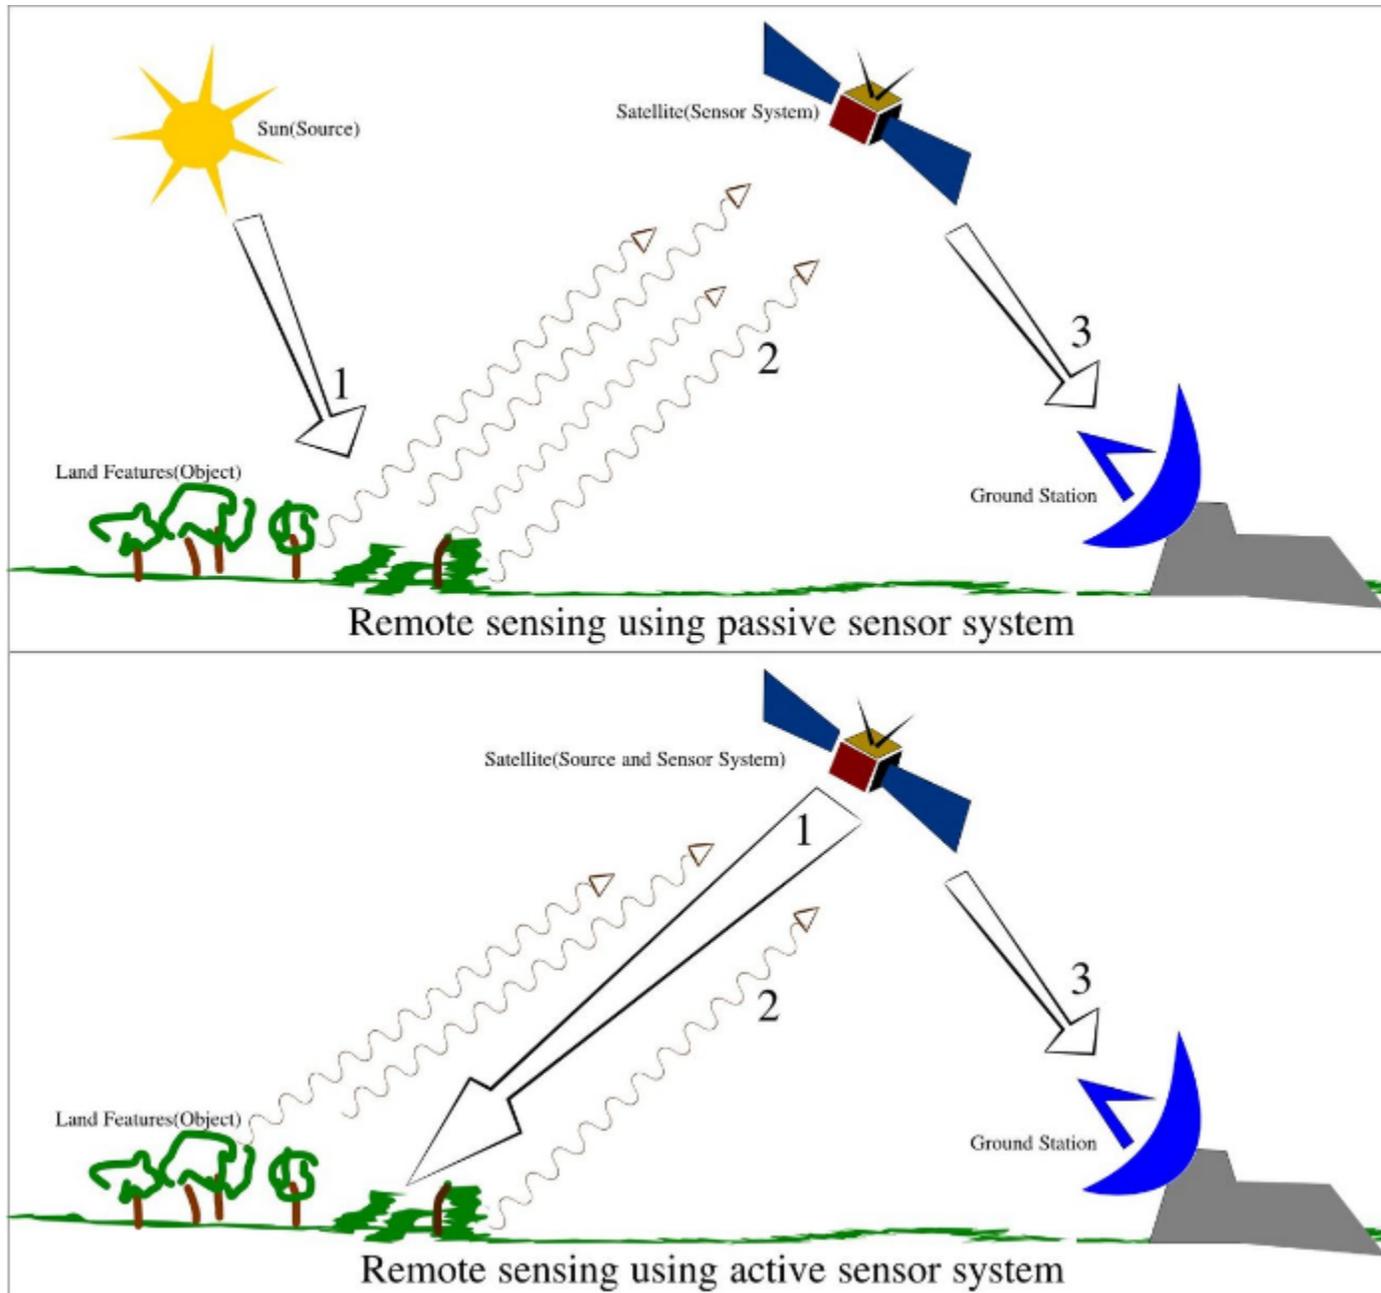

Basics of RS System: PASSIVE/ACTIVE

Passive satellite/sensors (OPTICAL):
Sentinel-2, ALOS AVNIR-2, PRISM;
Landsat Series; AVHRR, Spot, MODIS,
IKONOS, Quickbird, Worldview, etc.

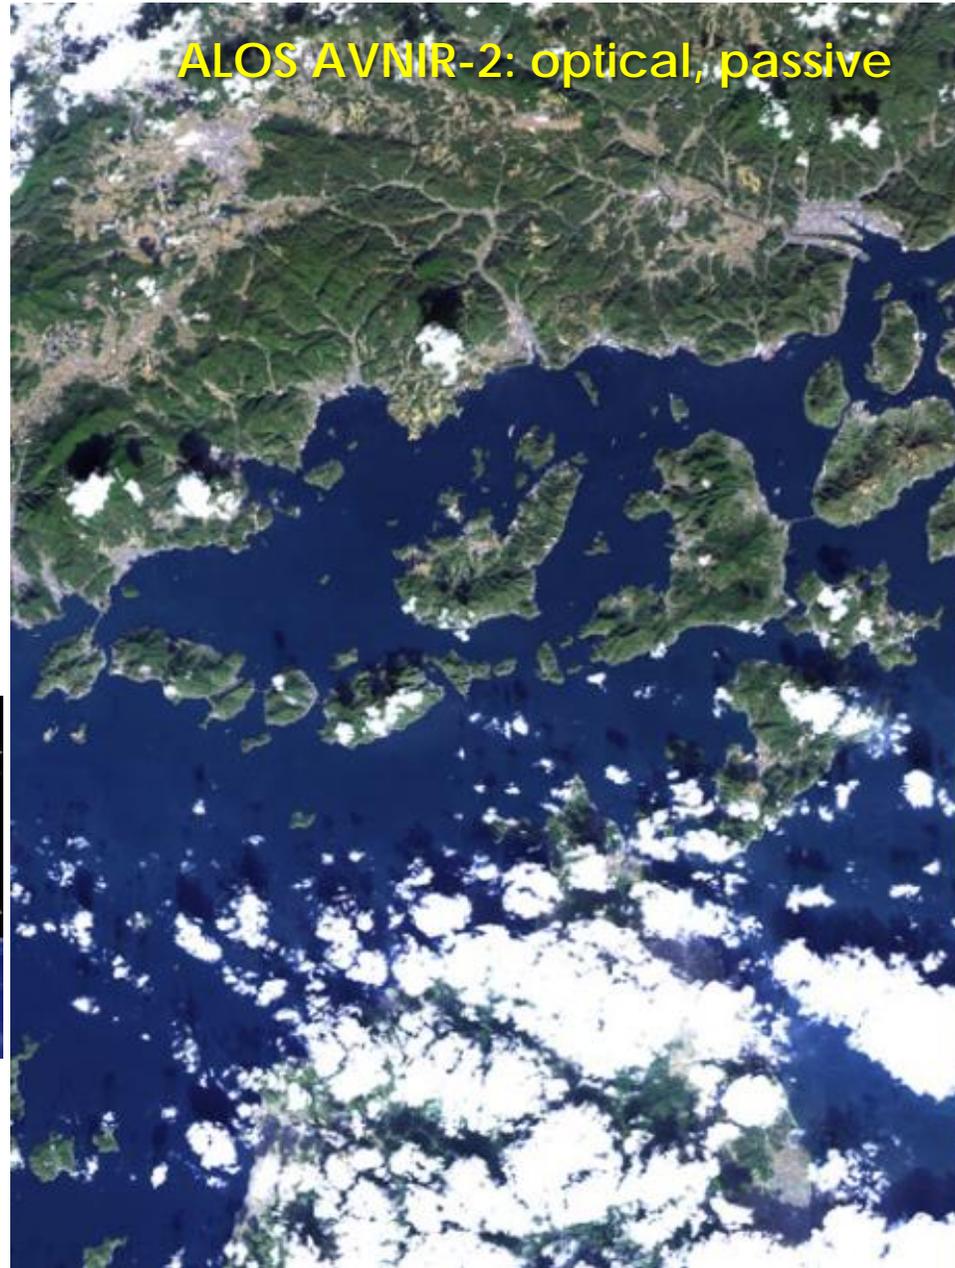

Active satellite/sensors (RADAR):
Sentinel-1, ALOS PALSAR, ALOS-2,
RADARSAT, TanDEM-X, TerraSAR-X, etc.

There are also some airborne sensor, such as
PiSAR, PiSAR-L2, LiDAR, etc. Recently UAVs
based small sensors are also getting popular

Satellite: 300~36000 km; Airborne: ~12 km

Optical vs
Radar: same
satellite, time
& location
but different
sensors

JAXA –Advanced Land
Observing Satellite (ALOS)

Optical vs Radar: Optical

Optical remote sensing makes use of visible, near infrared and short-wave infrared sensors to form images of the earth's surface by detecting the solar radiation reflected from targets on the ground. Different materials reflect and absorb differently at different wavelengths. Thus, the targets can be differentiated by their spectral reflectance signatures in the remotely sensed images. Optical systems are nadir looking!

- **Panchromatic imaging system:** this is a single channel detector sensitive to radiation within a broad wavelength range. If the wavelength range coincide with the visible range, then the resulting image resembles a "black-and-white" photograph taken from space.
- **Multispectral imaging system:** this is a multichannel detector. Each channel is sensitive to radiation within a narrow wavelength band. The resulting image is a multilayer image which contains both the brightness and spectral (colour) information of the targets being observed.
- **Hyperspectral imaging systems:** This acquires images in about a hundred or more contiguous spectral bands. The precise spectral information contained in a hyperspectral image enables better characterisation and identification of targets.

Optical vs Radar: Radar

Radio detection and ranging (radar) refers to a technique as well as an instrument.

The radar instrument emits electromagnetic pulses in the radio and microwave regime and detects the reflections of these pulses from objects in its line of sight.

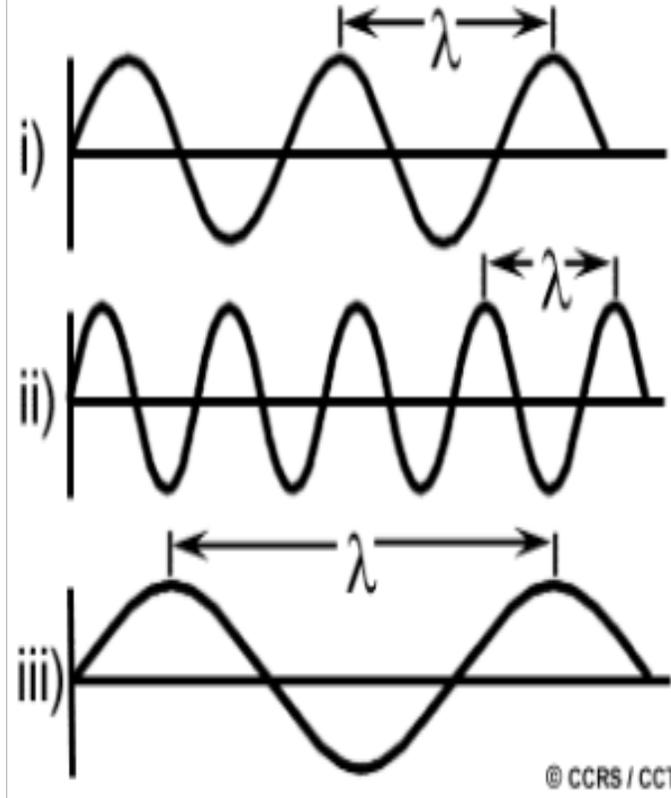

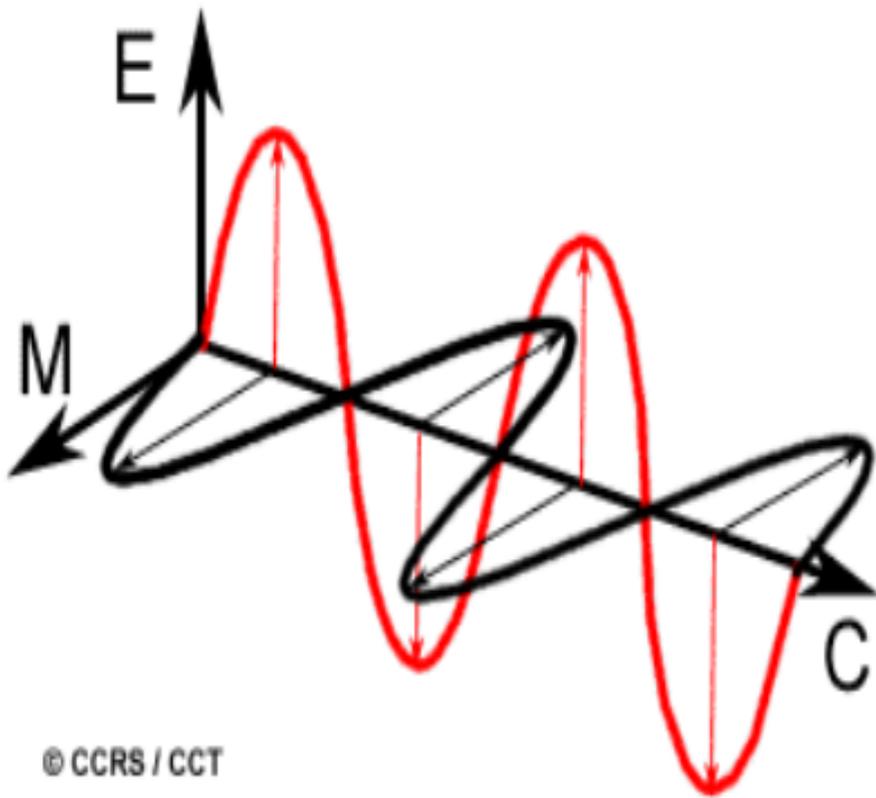

The radar technique uses the two-way travel time of the pulse to determine the range to the detected object and its backscatter intensity to infer physical quantities such as size or surface roughness.

Unlike optical, radar systems consists of all-weather and all-day capabilities allowing regular mapping of areas affected by heavy cloud cover, persistent rain, or extended darkness.

Radar systems are side looking! The signals interact differently with the surface than most other sensing systems, providing interesting new information about the observed environment.

Electromagnetic Radiation

Energy from any sources comes in the form of electromagnetic radiation

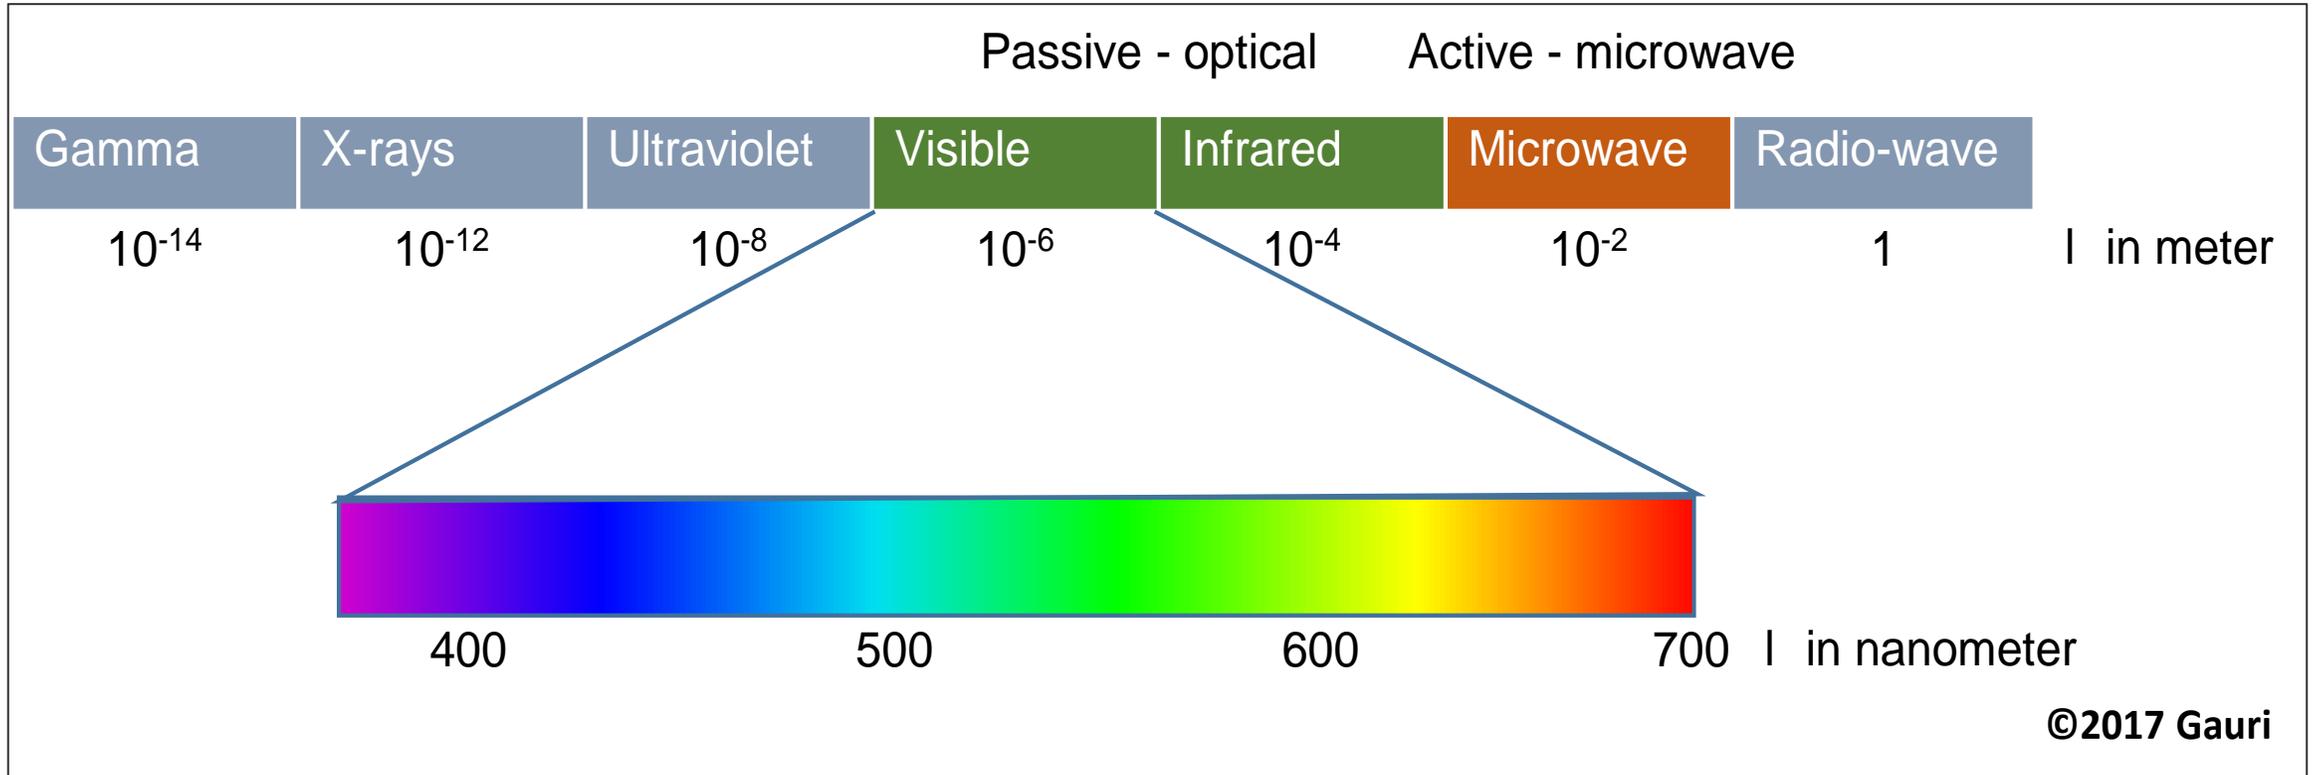

ER consists of Electrical field (E) and Magnetic field (M), travel at the speed of light (C).

Wavelength and Frequency. The wavelength is the length of one wave cycle, which can be measured as the distance (in m, cm, mm, and nm) between successive wave crests.

Frequency refers to the number of cycles of a wave passing a fixed point per unit of time. Frequency is normally measured in hertz (Hz), equivalent to one cycle per second, and various multiples of hertz. These two are inversely related to each other. The shorter the wavelength, the higher the frequency and vice-versa.

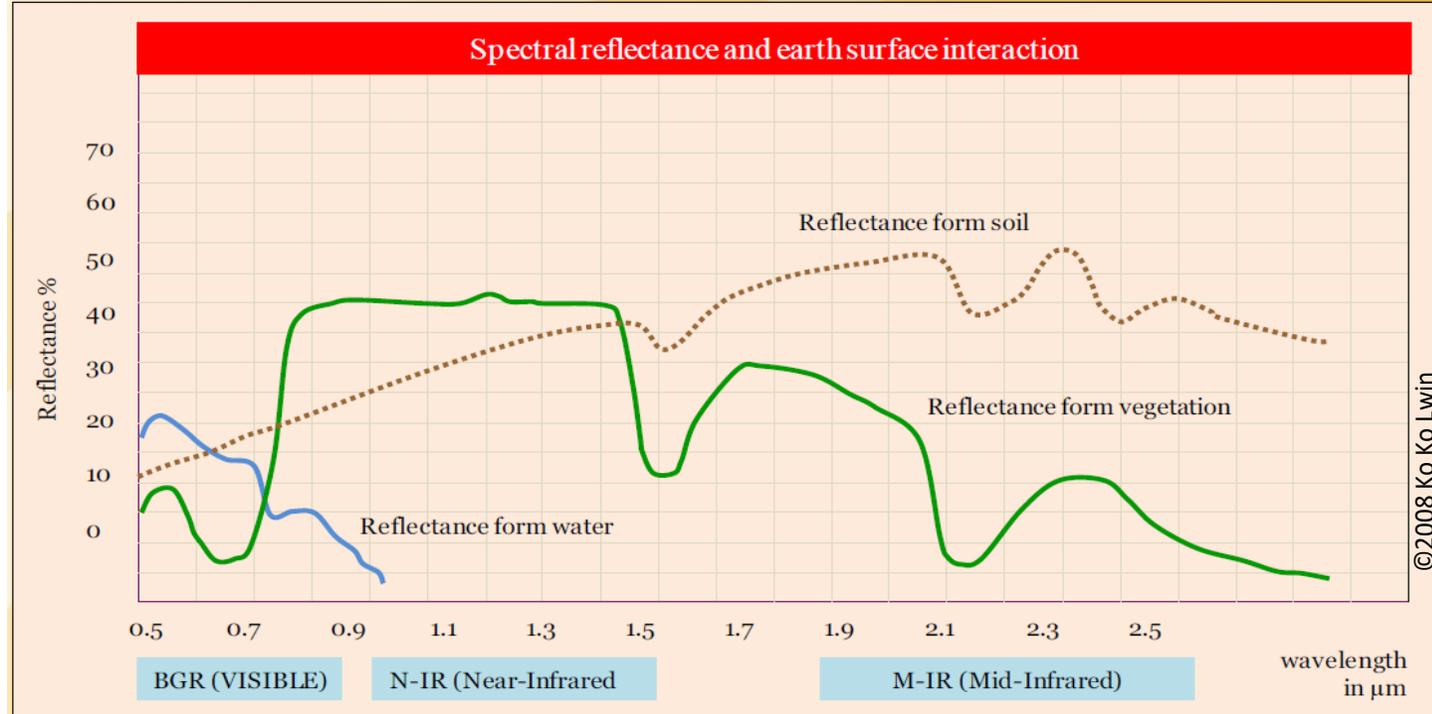

Electromagnetic Spectrum

From very short Gamma rays to very long radio waves

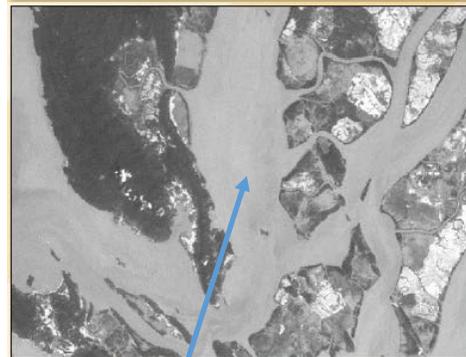

Blue (400 – 500), Green (500 – 600) and Red (600 – 700) bands

Spectral Properties of Objects

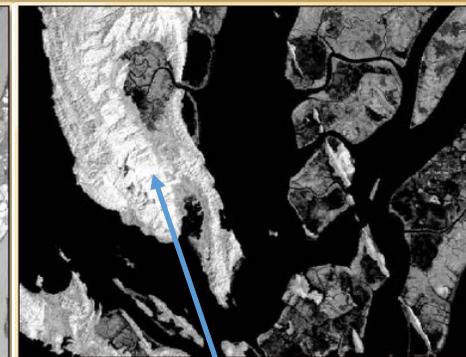

©2008 Ko Ko Lwin

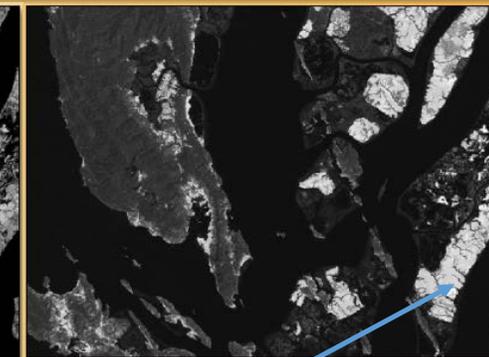

Surface category	Low reflectance	High reflectance
Water	N-IR (Near -Infrared)	Blue (Visible)
Vegetation	M-IR (Mid-Infrared)	N-IR (Near-Infrared)
Soil	Blue (Visible)	M-IR (Mid-Infrared)

TM B1: High reflectance in water

TM B4: High reflectance in vegetation

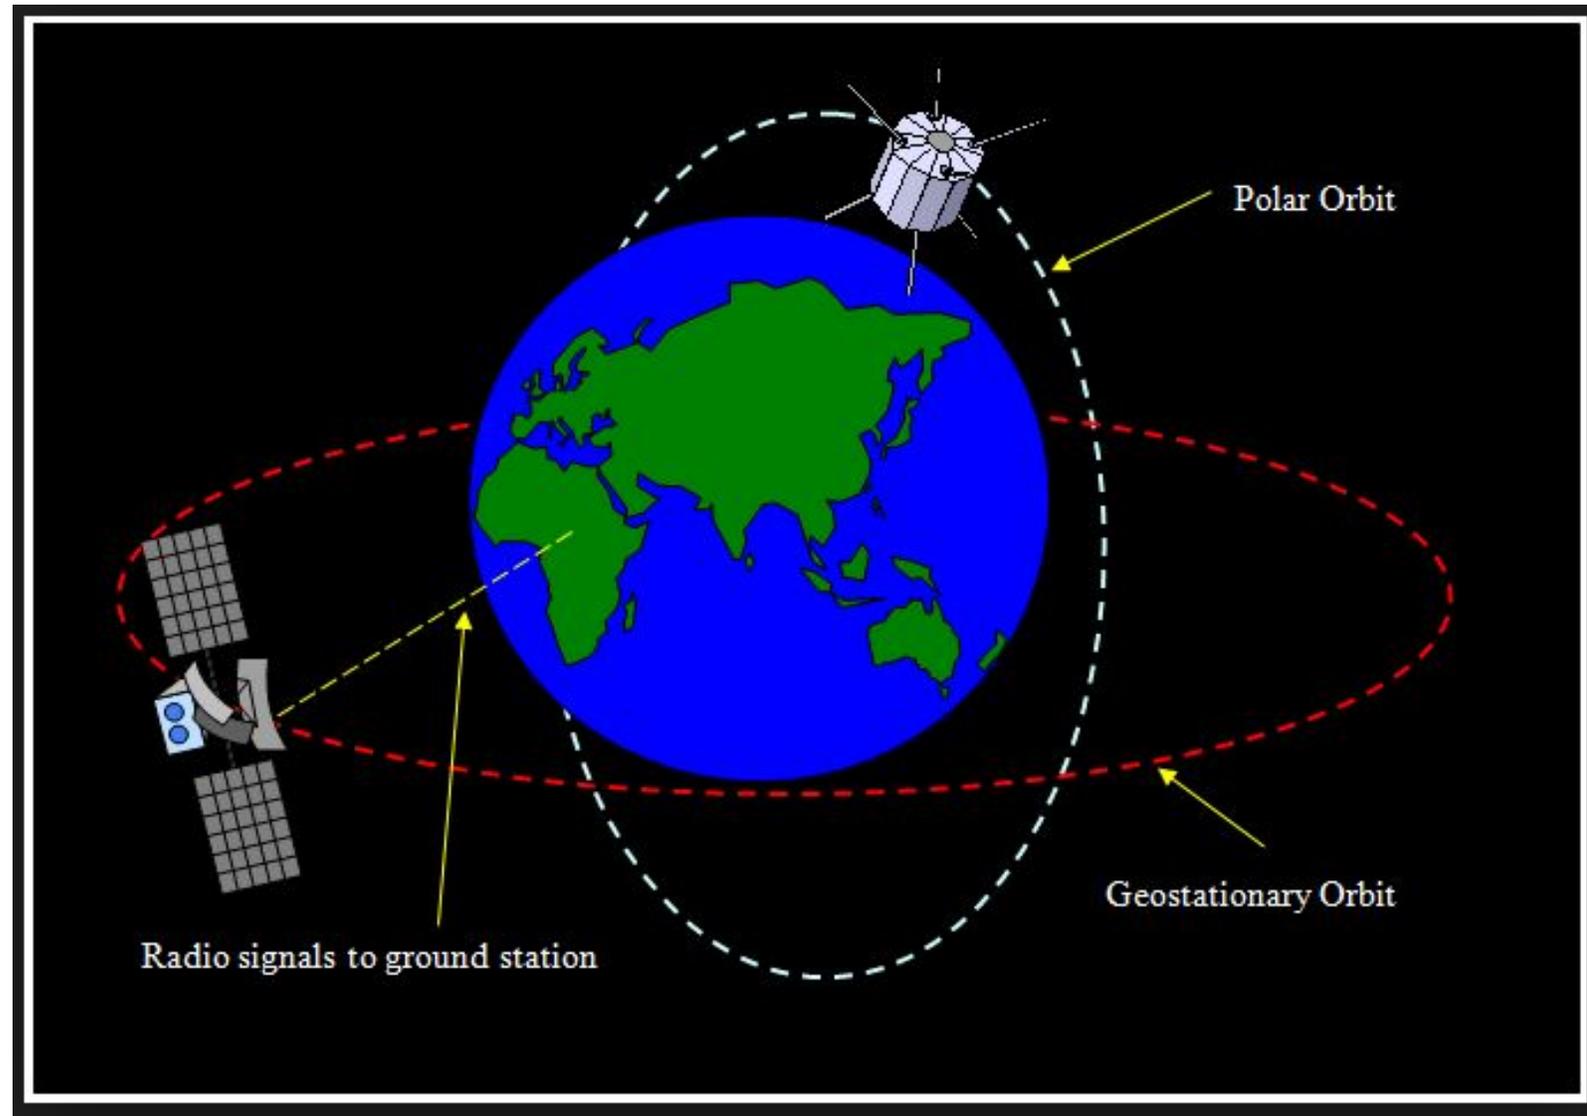

TM B7: High reflectance in bare soil

Types of Remote Sensing Images

Polar orbit (sun-synchronous), earth resources satellites, Landsat, SPOT, ALOS, IKONOS, QuickBird, etc.

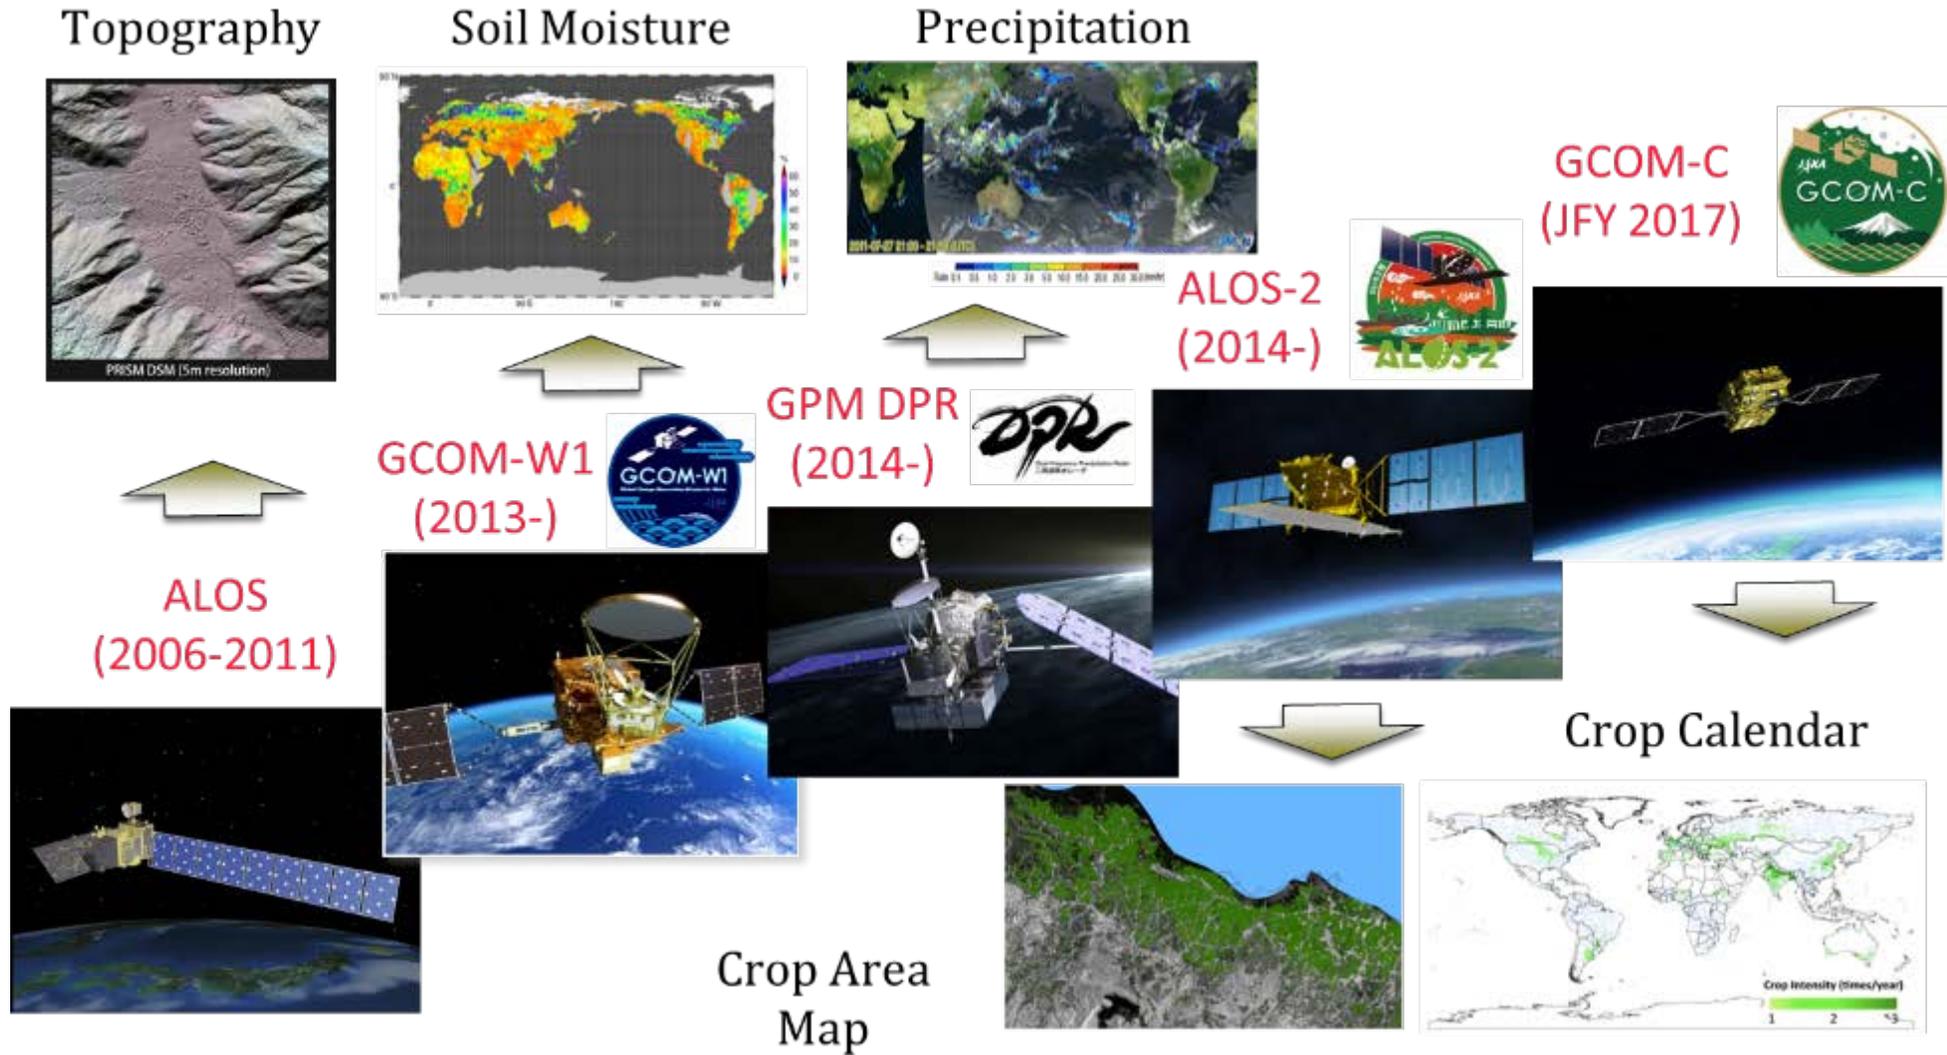

Geostationary orbit, directly over equator at very high altitudes and revolves in the same direction that the earth rotates (west to east), used in metrological, communication and broadcasting applications (e.g., GEOS, Meteosat, EDUSAT, GALAXY-27, KALPANA-1, etc.).

Characteristics of Remotely Sensed Imagery

Remote sensing systems differ in the level of detail or resolution they can capture, and data are available at a variety of resolutions, we will cover four types of satellite resolution:

- 1) **Spectral Resolution** – refers to the degree to which a satellite sensor can distinguish or resolve features of the electromagnetic spectrum
- 2) **Radiometric Resolution** – refers to the number of quantized bits that are used for recording the reflected electromagnetic energy.
- 3) **Spatial Resolution** – refers to the number of pixels utilized in construction of a digital image. Images having higher spatial resolution are composed of a greater number of pixels than those of lower resolution.
- 4) **Temporal Resolution** – refers to the frequency of a measurement with respect to time. Often there is a trade-off between temporal and spatial resolution.

Spectral Resolution

Radiometric Resolution

8-bit quantization (256 levels)

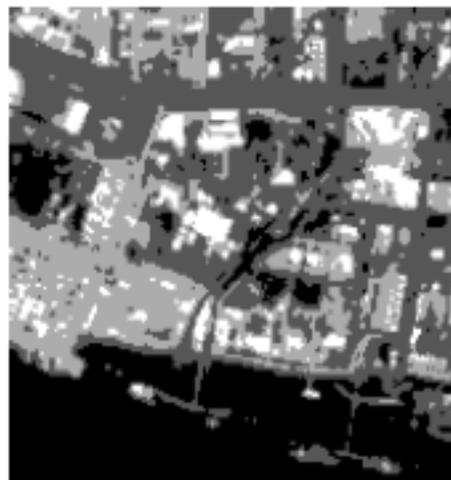

6-bit quantization (64 levels)

4-bit quantization (16 levels)

3-bit quantization (8 levels)

2-bit quantization (4 levels)

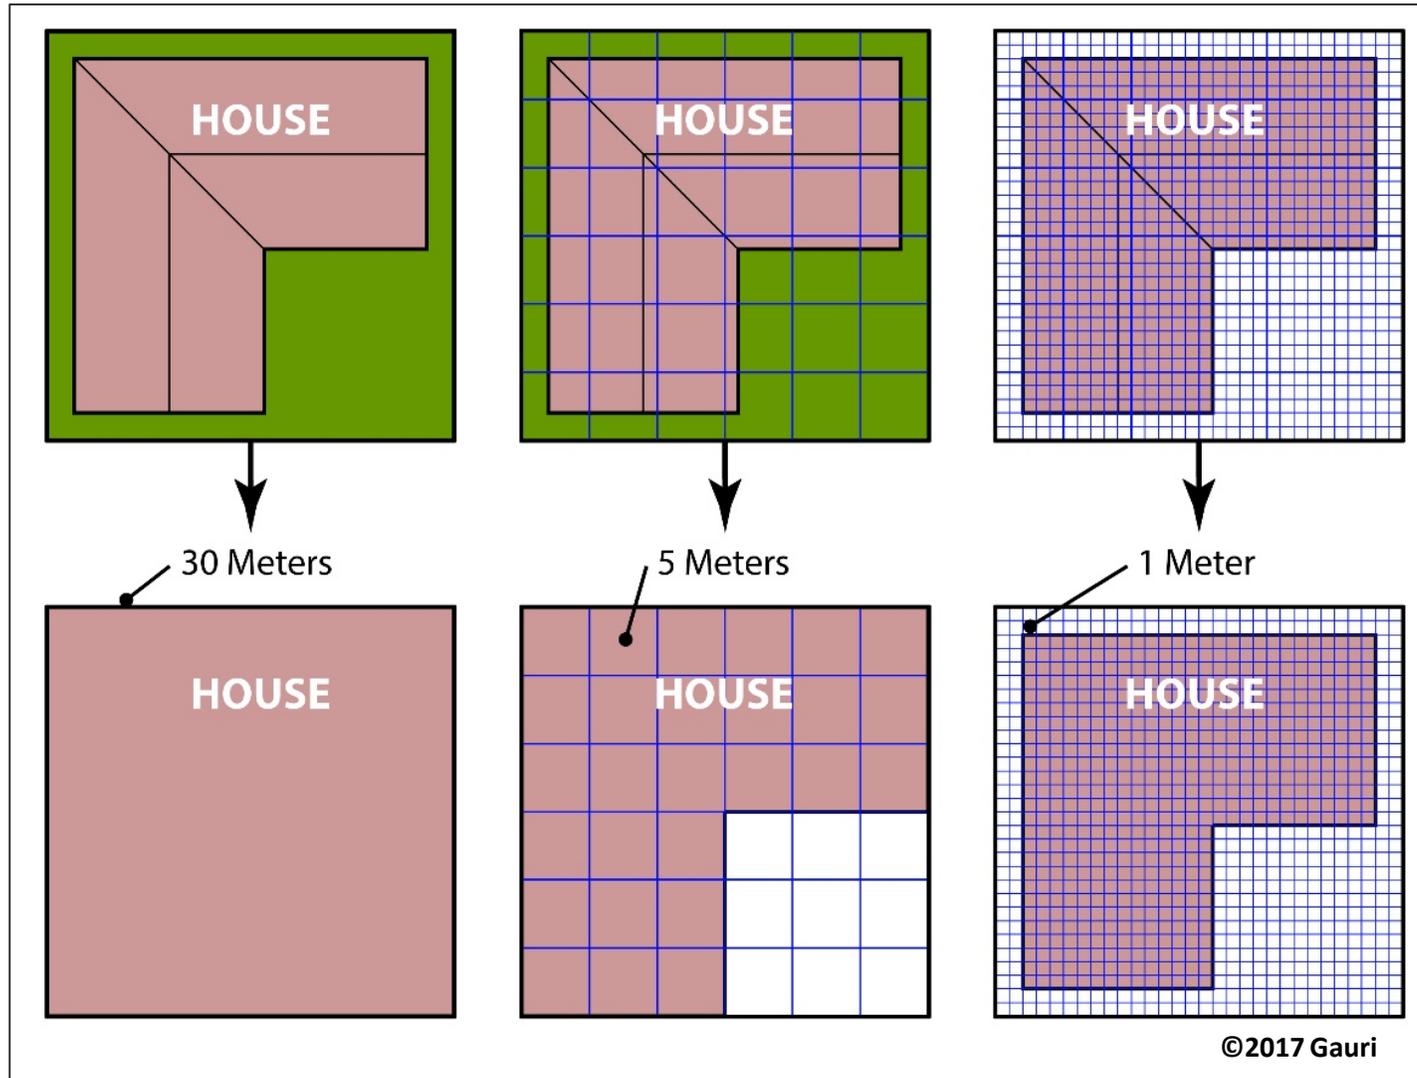

1-bit quantization (2 levels)

© GESAAF

The radiometric resolution of image data in remote sensing stands for the ability of the sensor to distinguish different grey-scale values. It is measured in bit. The more **bit** an image has, the more grey-scale values can be stored, and, thus, more differences in the reflection on the land surfaces can be spotted.

A bit is a binary number that is 0 or 1. For computer processing, the byte unit (1 byte = 8bits; covers integer value between 0-255; or 256 grey levels)

Spatial Resolution

Spatial Resolution

Satellite	Resolution	Satellite	Resolution
GeoEye	0.41m	ALOS	2.5m~100m
Worldview 1, 2	0.46m	ALOS 2	3m~100m
Pleiades-1A	0.5m	Sentinel 1	5m~100m
Quickbird	0.61m	Sentinel 2	10m~60m
Ikonos	0.82m	ASTER	15m
SPOT 5, 6	1.5 – 5 m	LANDSAT	15m~60m
Rapid Eye	5m	MODIS	250~1000m

PC: Thapa 25.12.2018

Faisal Masjid, Google Earth Imagery, 18.06.2019

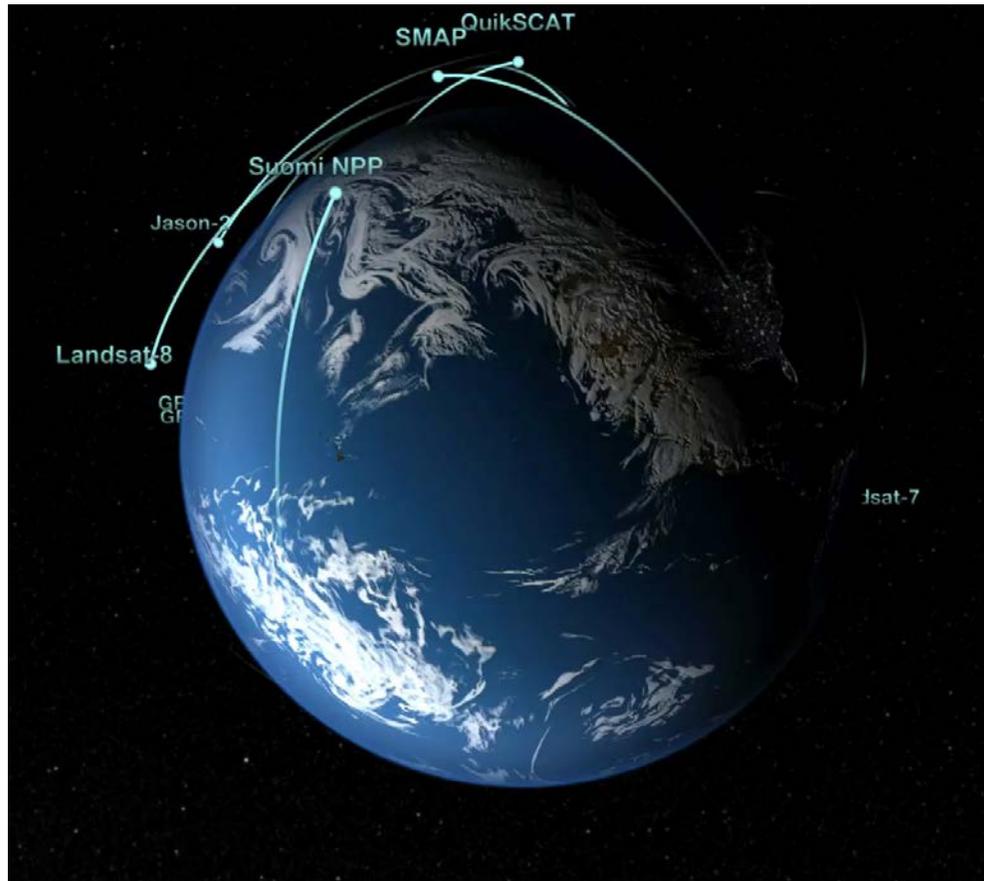

Temporal Resolution

The temporal resolution specifies the revisiting frequency of a satellite sensor for a specific location.

High temporal resolution: < 24hours – 3days

Medium temporal resolution: 4-16 days

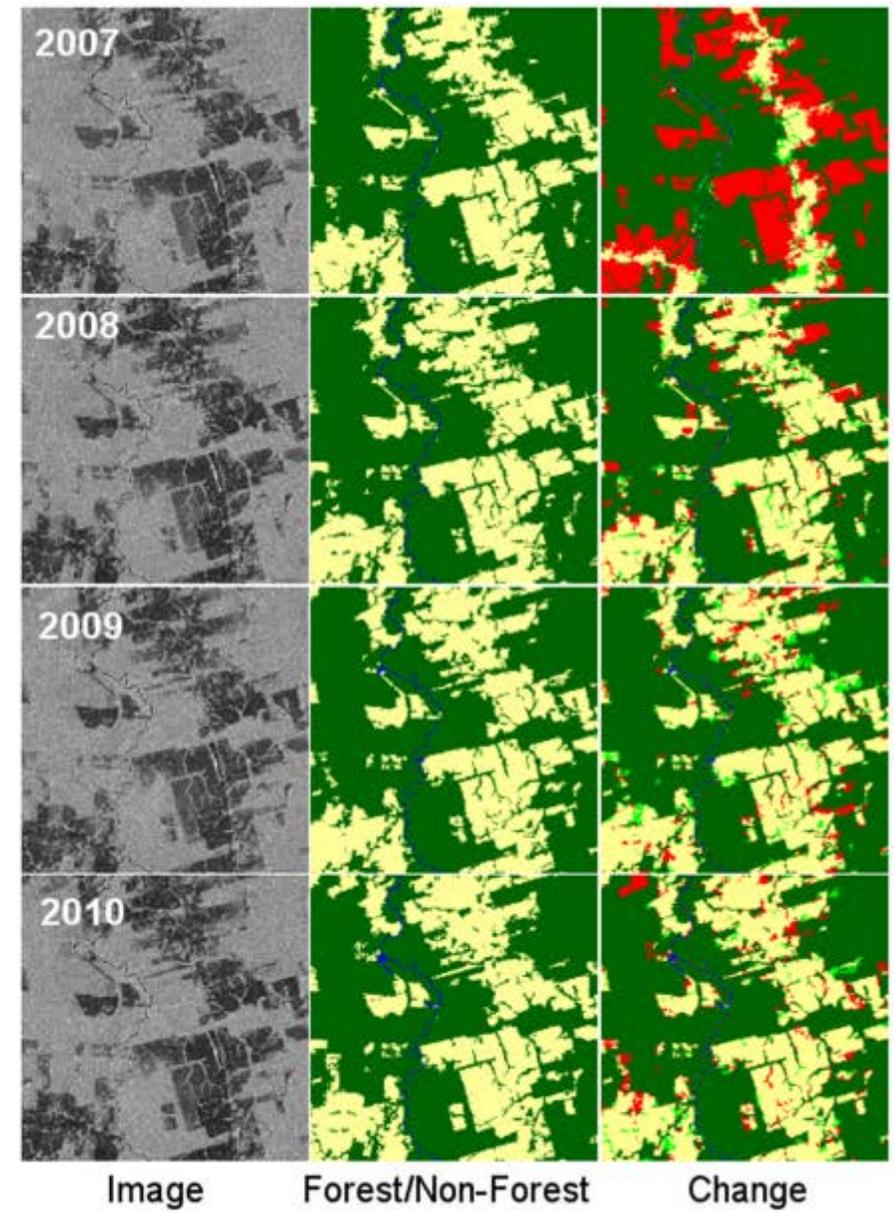

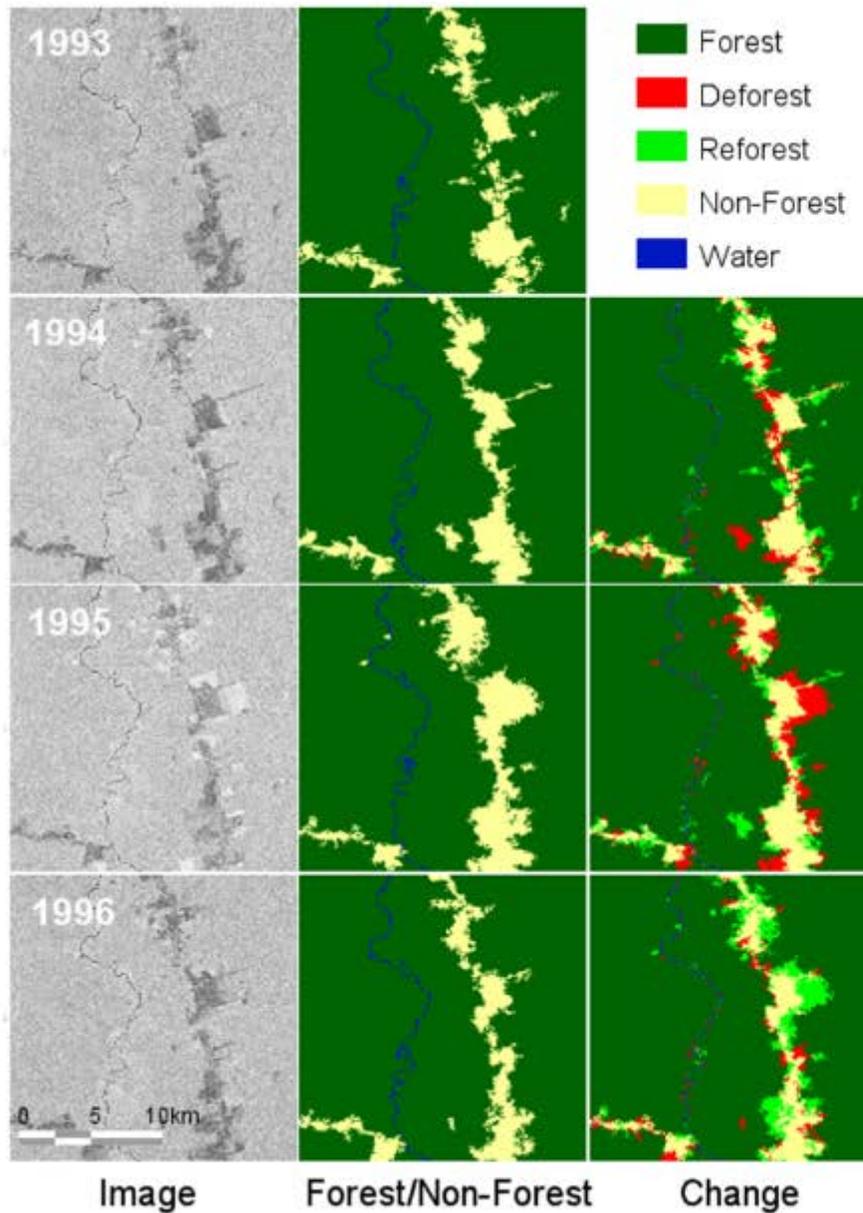

Low temporal resolution: > 16 days

Settlement bubbles in Manohara (Thapa et al. 2008. City Profile: Kathmandu)

Temporal Resolution - Forest change in Para, Amazon (Radar Data: JERS-1, ALOS/PALSAR)

Forest monitoring!
Can any one articulate, what did you see in 2007?

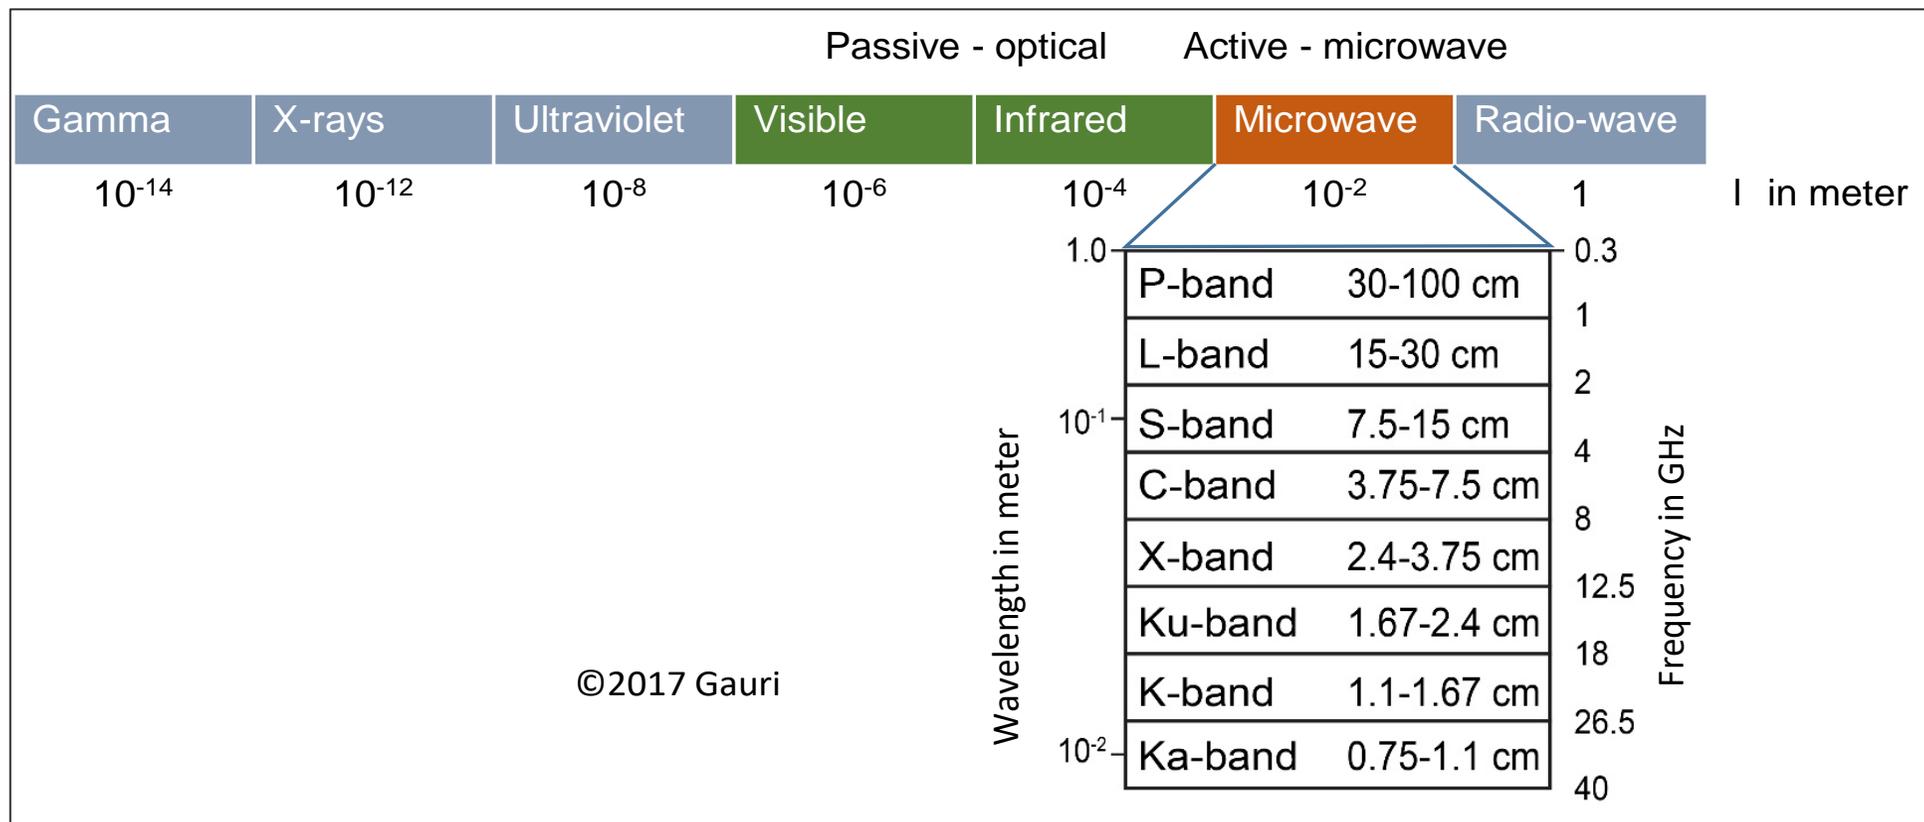

(C)JAXA, METI analyzed by JAXA

Spectral Bands Commonly Used in Remote Sensing

Spectral bands (μm)	Applications
Blue (0.45 – 0.52)	analysis of water characteristics, water depth, and the detection of subsurface features
Green (0.52 – 0.60)	water quality studies measuring sediment and chlorophyll concentration
Red (0.63 – 0.69)	discriminating vegetation types, assessing plant condition, delineating soil and geologic boundaries, and identifying cultural features
Panchromatic (0.50 – 0.90)	digitally combined with two or three of the multispectral bands to produce color images with spatial detail of the panchromatic image and the spectral detail of the multispectral bands
Near Infrared (0.7 – 1.0)	useful for vegetation mapping, crop condition monitoring, biomass estimation, and soil moisture assessment
Shortwave Infrared (1.0 – 3.0)	useful for analyzing moisture levels in soil and for monitoring plant vigor and crop condition, distinguishing clouds from snow and ice
Medium wave (3.0 - 8) and Long Wave Infrared (8 – 14)	useful to measure the temperature of features such as industrial sites, pipelines carrying heated materials, geothermal sites, and thermal pollution, also useful for the analysis of vegetation stress, soil moisture, and geology
Microwave region (radar)	useful for mapping of vegetation structure and biomass, flooding, geological sites, etc.

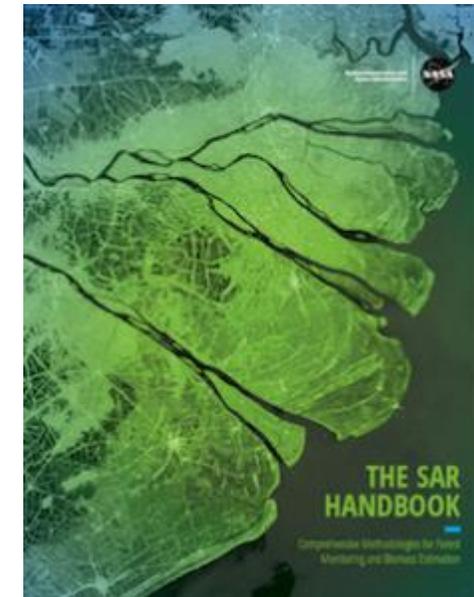

Spectrum of Microwave Region

The microwave region of the spectrum is quite large, relative to the visible and infrared, and there are several wavelength ranges from 0.1cm to 100cm (300GHz to 0.3GHz in frequency) with unique code band. Microwaves with longer wavelengths than Ka-band (7.5mm) are generally used as radar. [Currently, X-band, C-band, and L-band are in operation in Earth observation satellites, i.e., TerraSAR-X, Sentinel-1, ALOS-2, respectively](#)

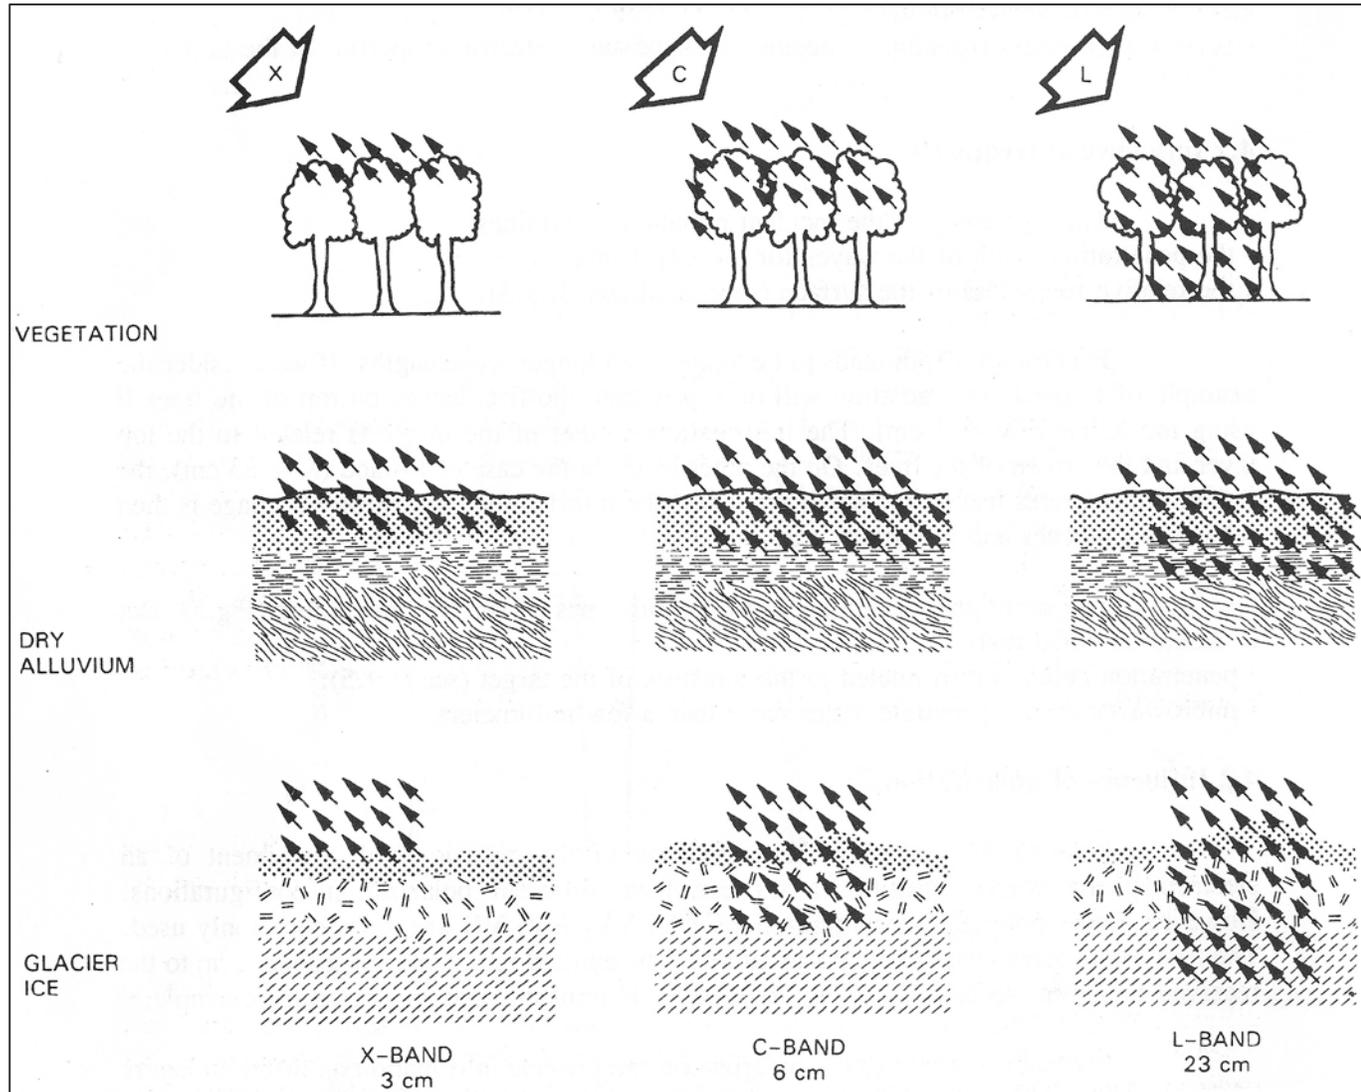

Spectrum of Microwave Region

SAR Band	Frequency	Wavelength	Typical Application
Ka	27 – 40 GHz	1.1 – 0.8 cm	Rarely used for SAR (airport surveillance)
K	18 – 27 GHz	1.7 – 1.1 cm	Rarely used (H ₂ O absorption)
Ku	12 – 18 GHz	2.4 – 1.7 cm	Rarely used for SAR (satellite altimetry)
X	8 – 12 GHz	3.8 – 2.4 cm	High resolution SAR (urban monitoring; ice and snow, little penetration into vegetation cover; fast coherence decay in vegetated areas)
C	4 – 8 GHz	7.5 – 3.8 cm	SAR workhorse (global mapping; change detection; monitoring of areas with low to moderate vegetation; improved penetration; higher coherence); Ice, ocean, maritime navigation
S	2 – 4 GHz	15 – 7.5 cm	Little but increasing use for SAR-based Earth observation; agriculture monitoring (NISAR will carry an S-band channel; expands C-band applications to higher vegetation density)
L	1 – 2 GHz	30 – 15 cm	Medium resolution SAR (Geophysical monitoring; biomass and vegetation mapping; high penetration; <u>InSAR</u>)
P	0.3 – 1 GHz	100 – 30 Cm	Biomass. First P-band spaceborne SAR will be launched around 2020; vegetation mapping and assessment. Experimental SAR.

Advantages of Microwave Signals

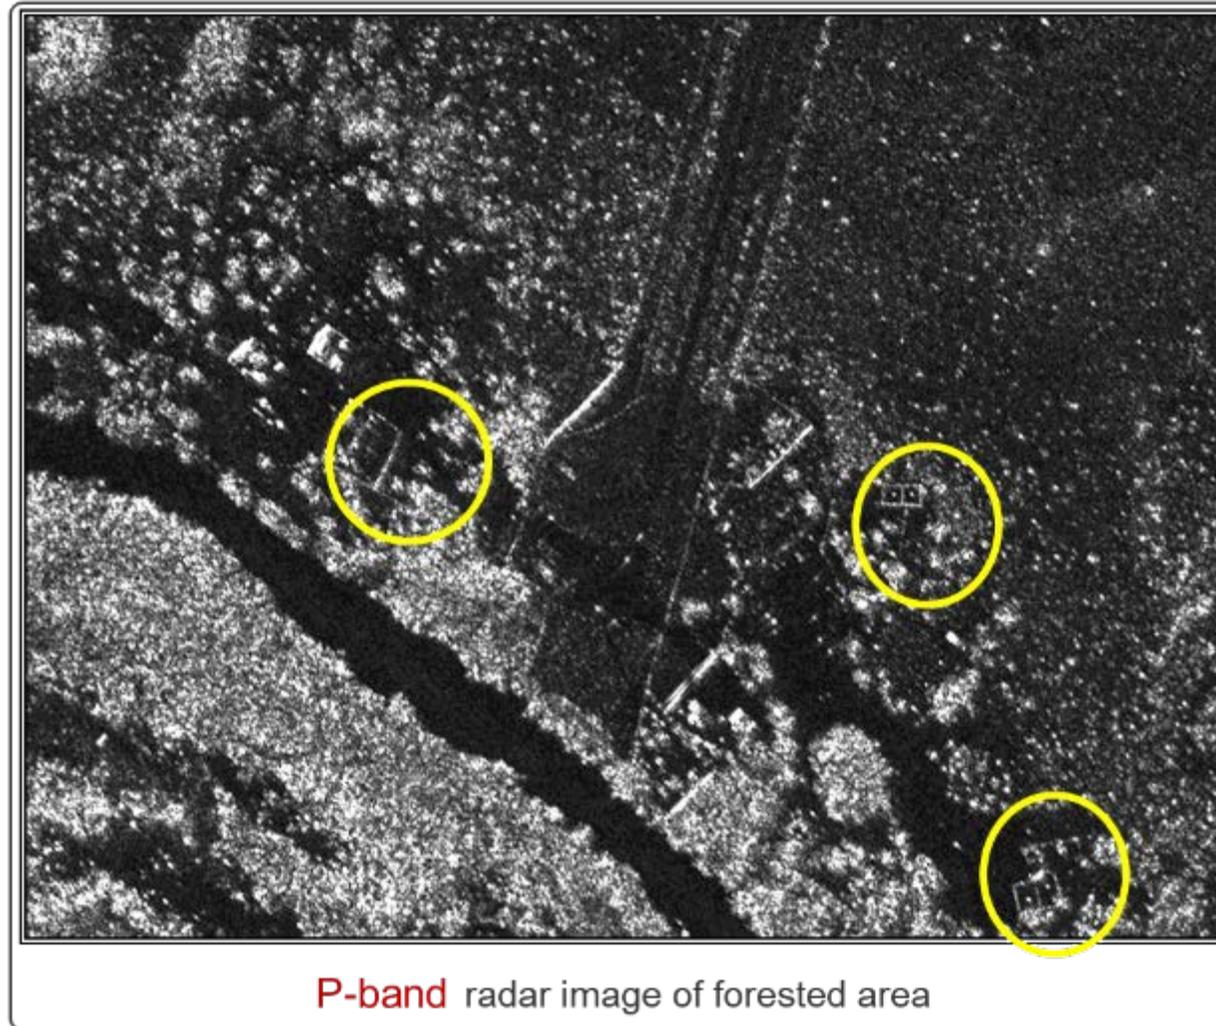

This figure provides a conceptual overview of the influence of sensor wavelength λ on signal penetration into a variety of surface types. The radar signals penetrate deeper as sensor wavelength increases. This is related to the dependence of the dielectric constant ϵ_r on the incident wavelength, allowing for higher penetration at L-band than at C- or X-band.

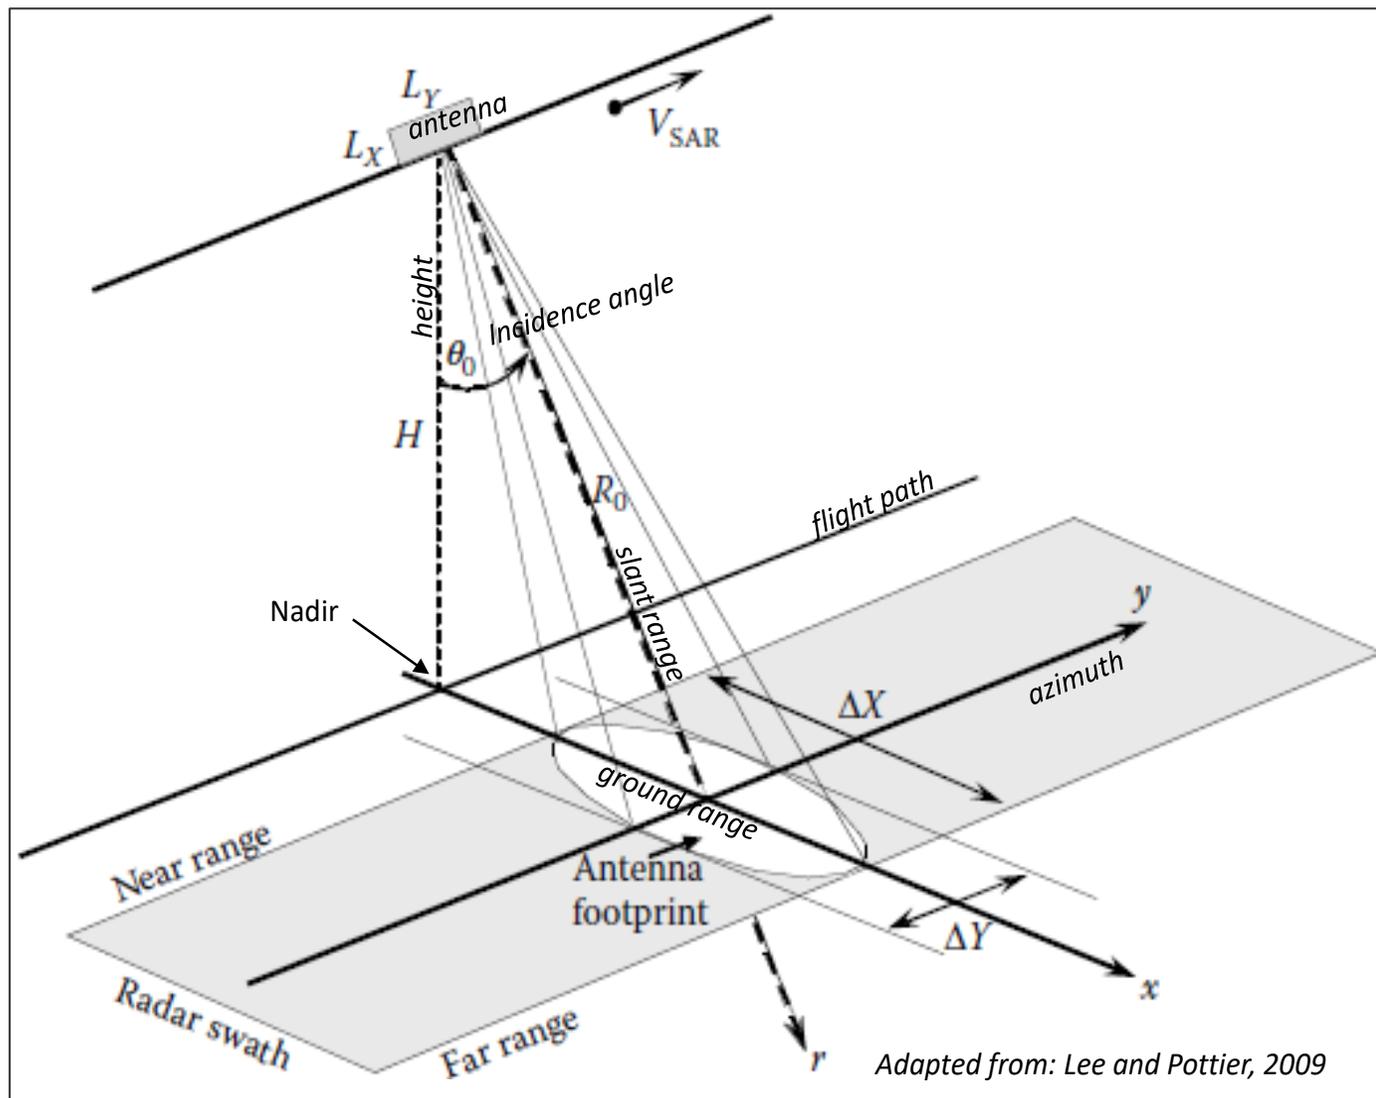

Effects of Different Bands in Surface Penetration

Effects of Different Bands in Surface Penetration

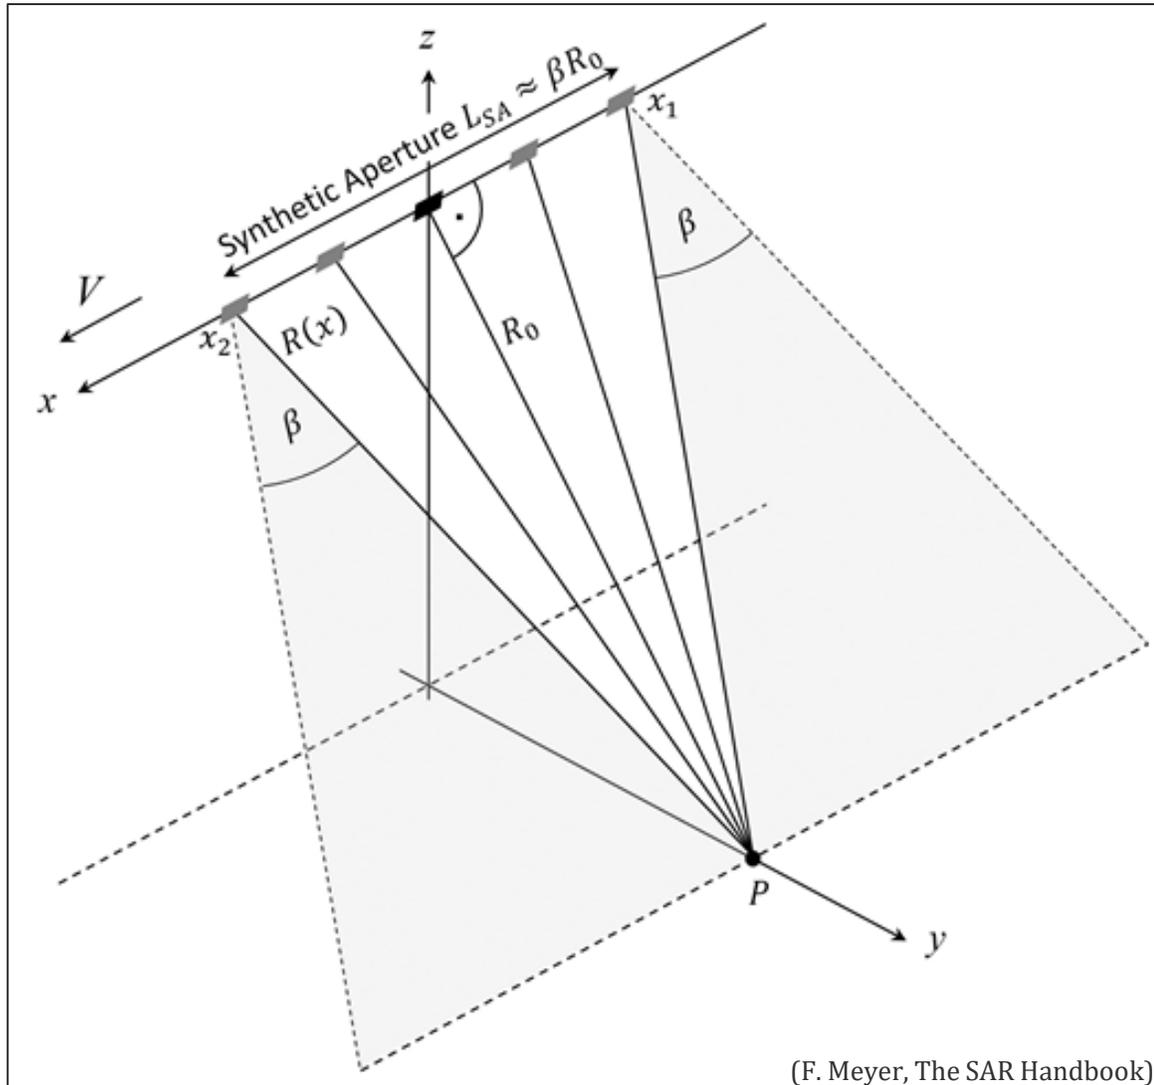

Observation Geometry of Imaging Radars

Side-looking geometry

The figure is a schematic diagram of a radar observation geometry where a platform is moving along a straight path at altitude H . Unlike most optical imaging systems, which point their sensors towards nadir, the antenna of imaging radar is pointed away from nadir by a look angle.

Synthetic Aperture Radar (SAR)

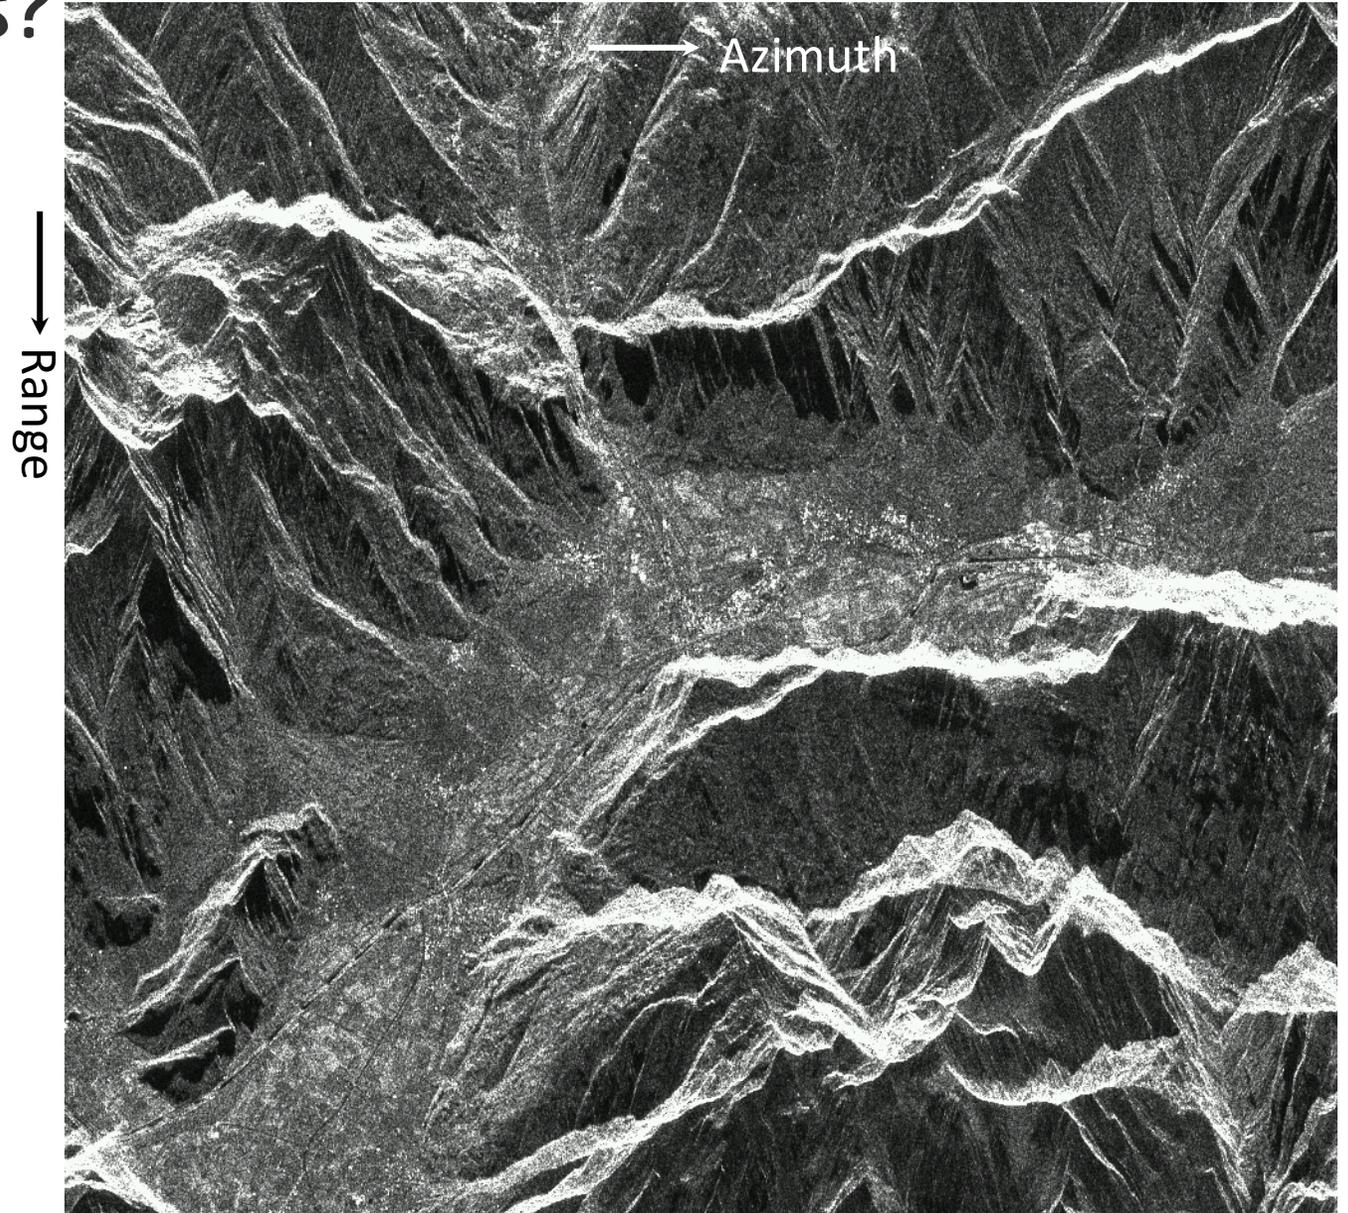

A radar antenna (indicated by a gray rectangle) of reasonably short length is moving at a velocity V along its flight path from the right to the left. While moving, it is constantly transmitting short radar pulses and is receiving echoes returned from objects on the ground. Each radar pulse illuminates an instantaneous footprint of size S on the Earth surface.

SAR is an active sensor transmitting a microwave signal towards a target and receive a reflection called backscatter

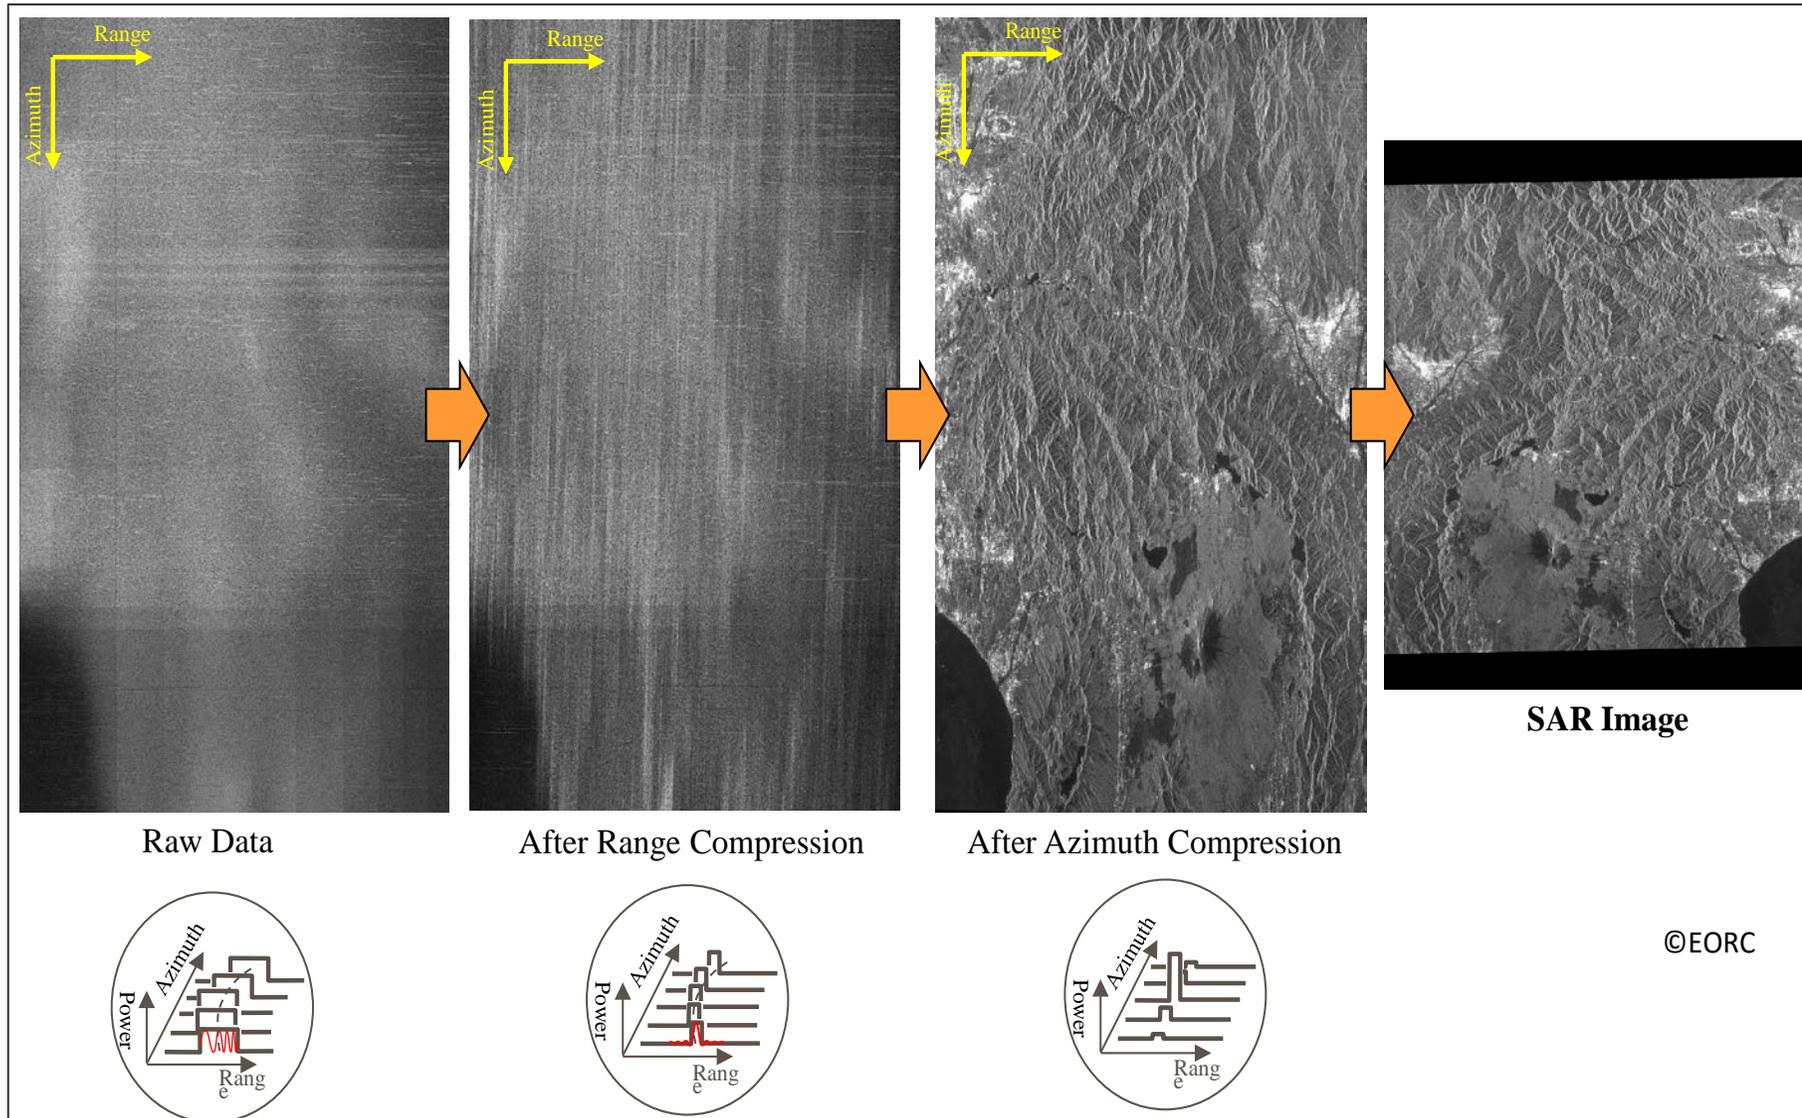

How Imaging Radar Works?

Identify the directions for Azimuth and Range

Tips:
Imaging radars are side-looking!

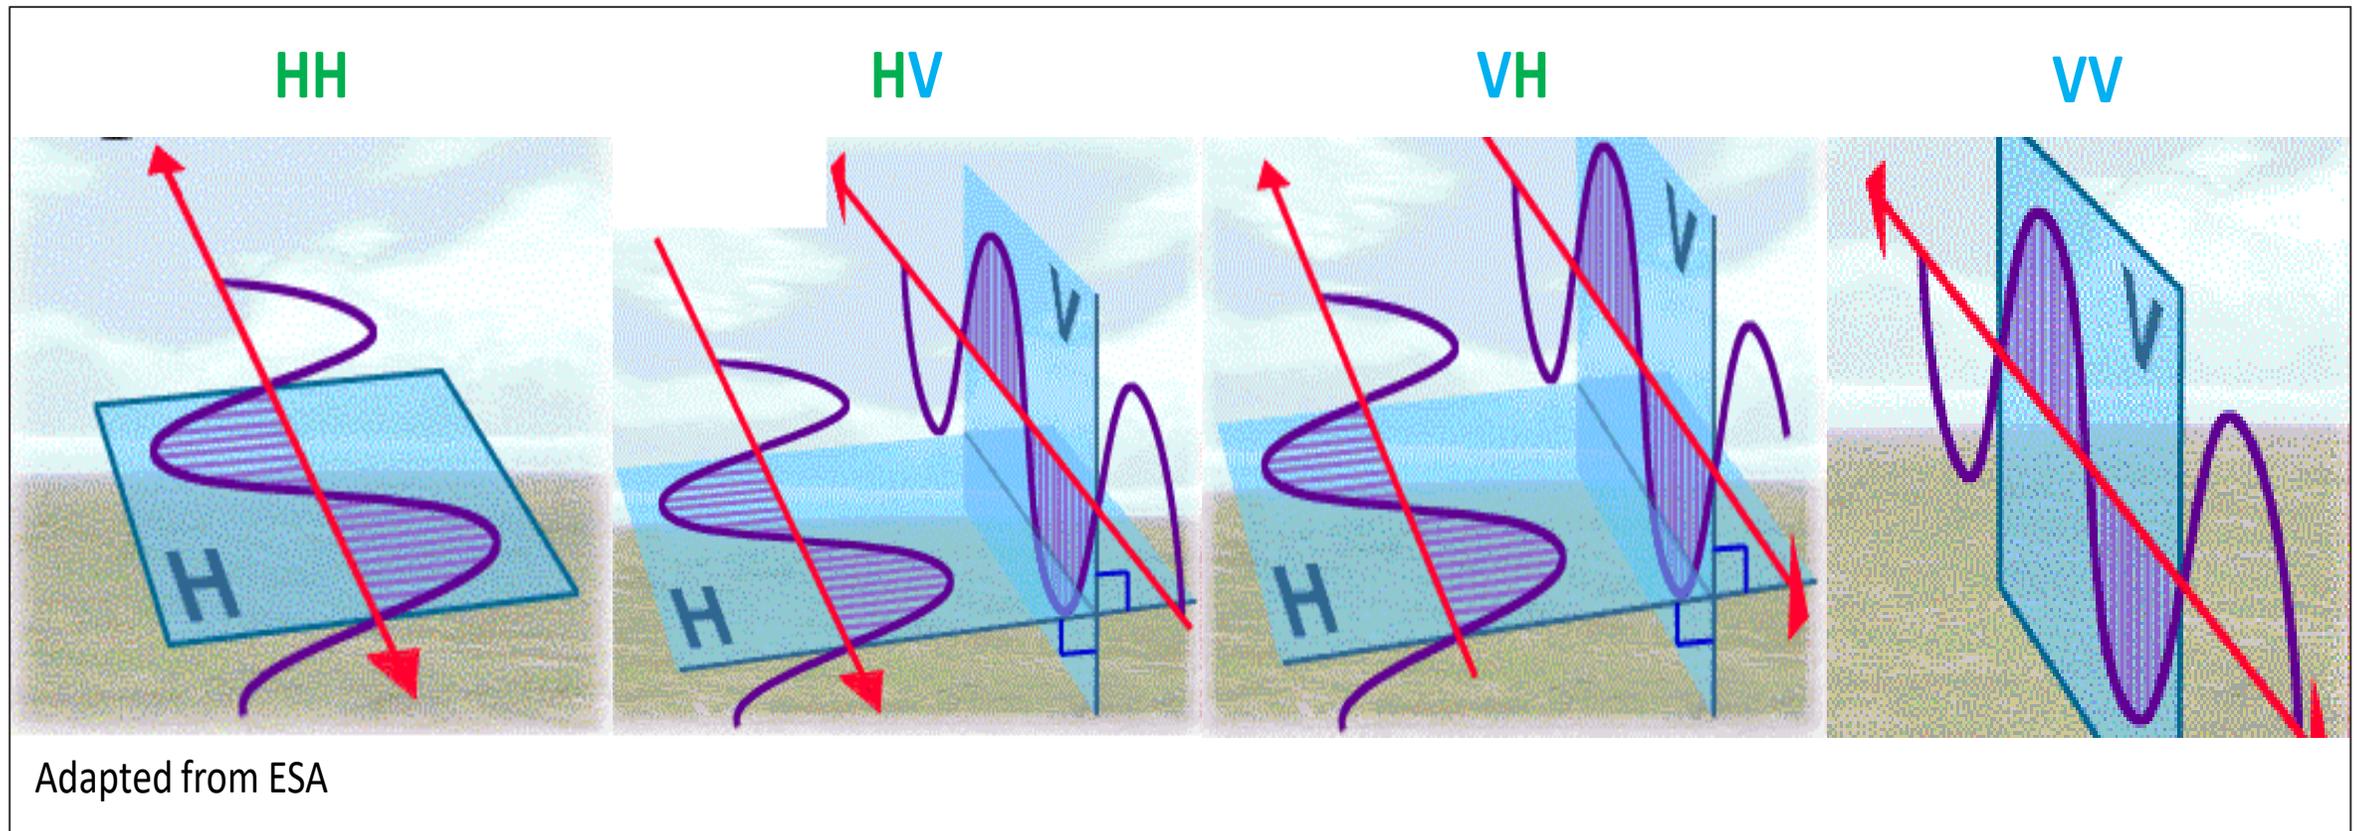

SAR Image Processing Flow

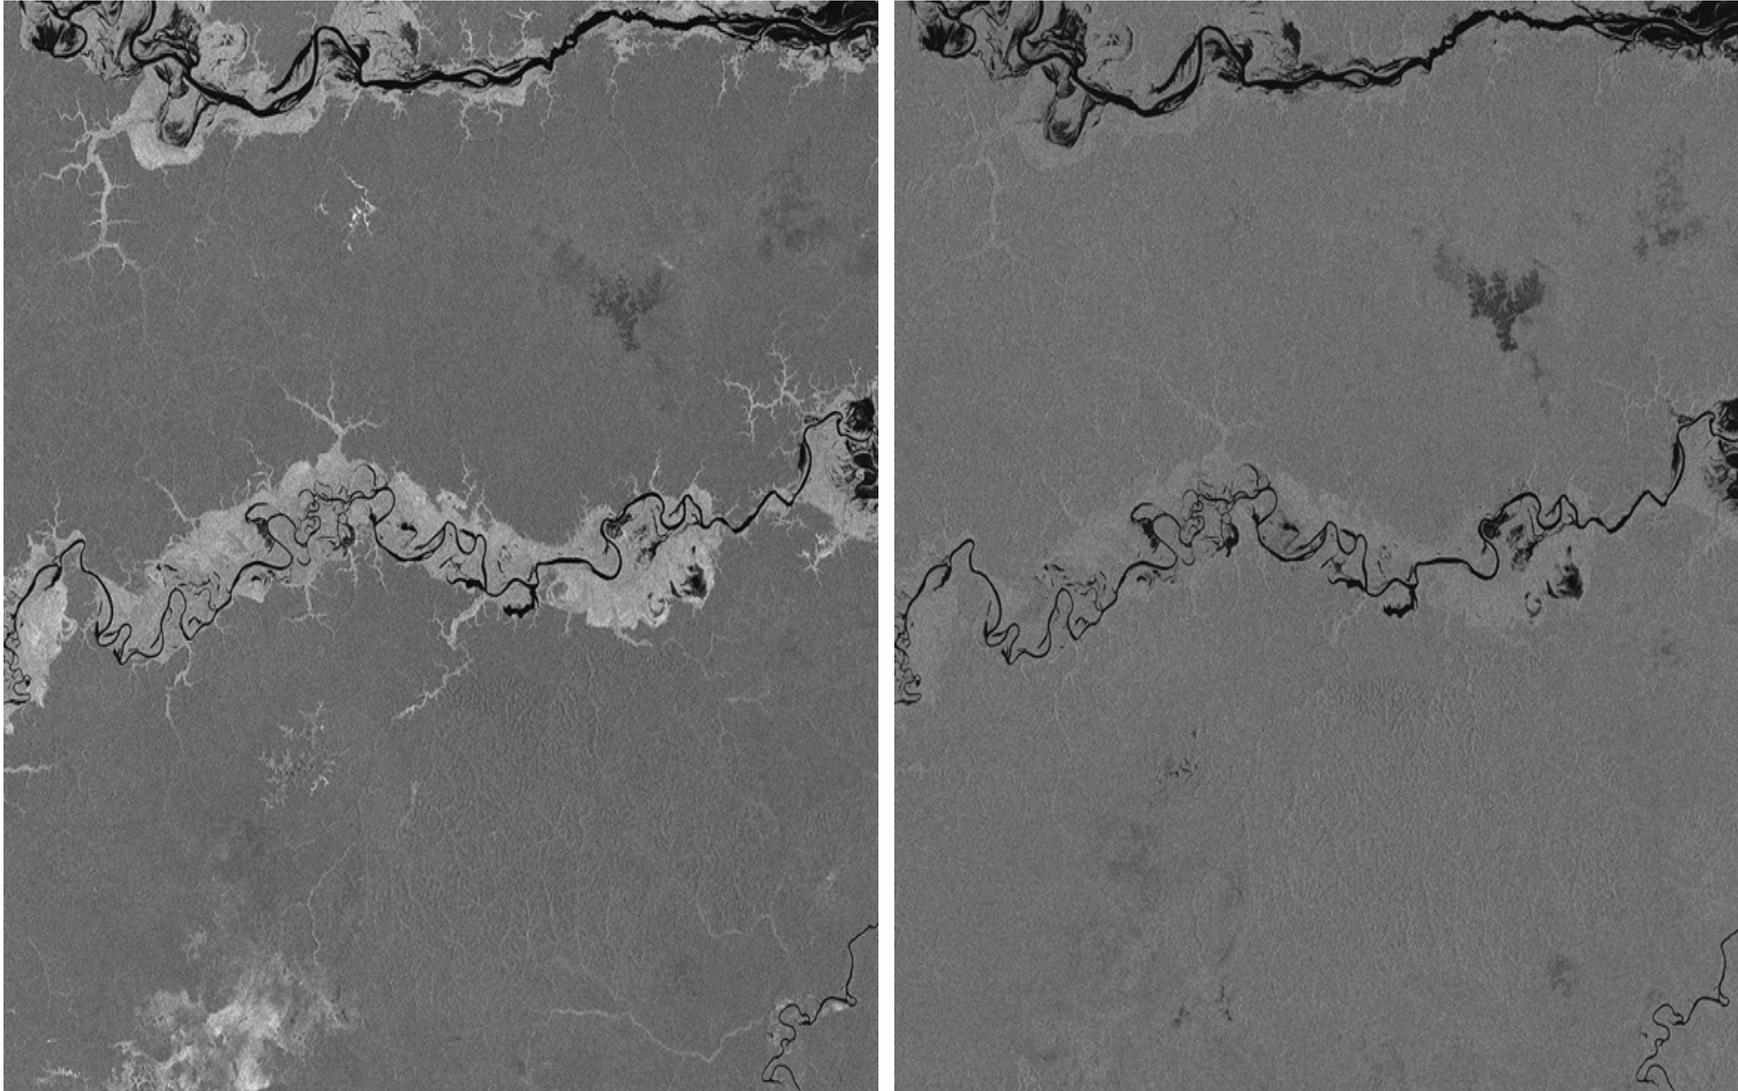

SAR image is constructed from the many pulses reflected by each single target and received by the antenna and registered at all position along the flight path. Then image processing algorithm performs range and azimuth compressions to create 2-D SAR image

Radar Polarizations

Most radars are designed to transmit microwave radiation either horizontally polarized (H) or vertically polarized (V)

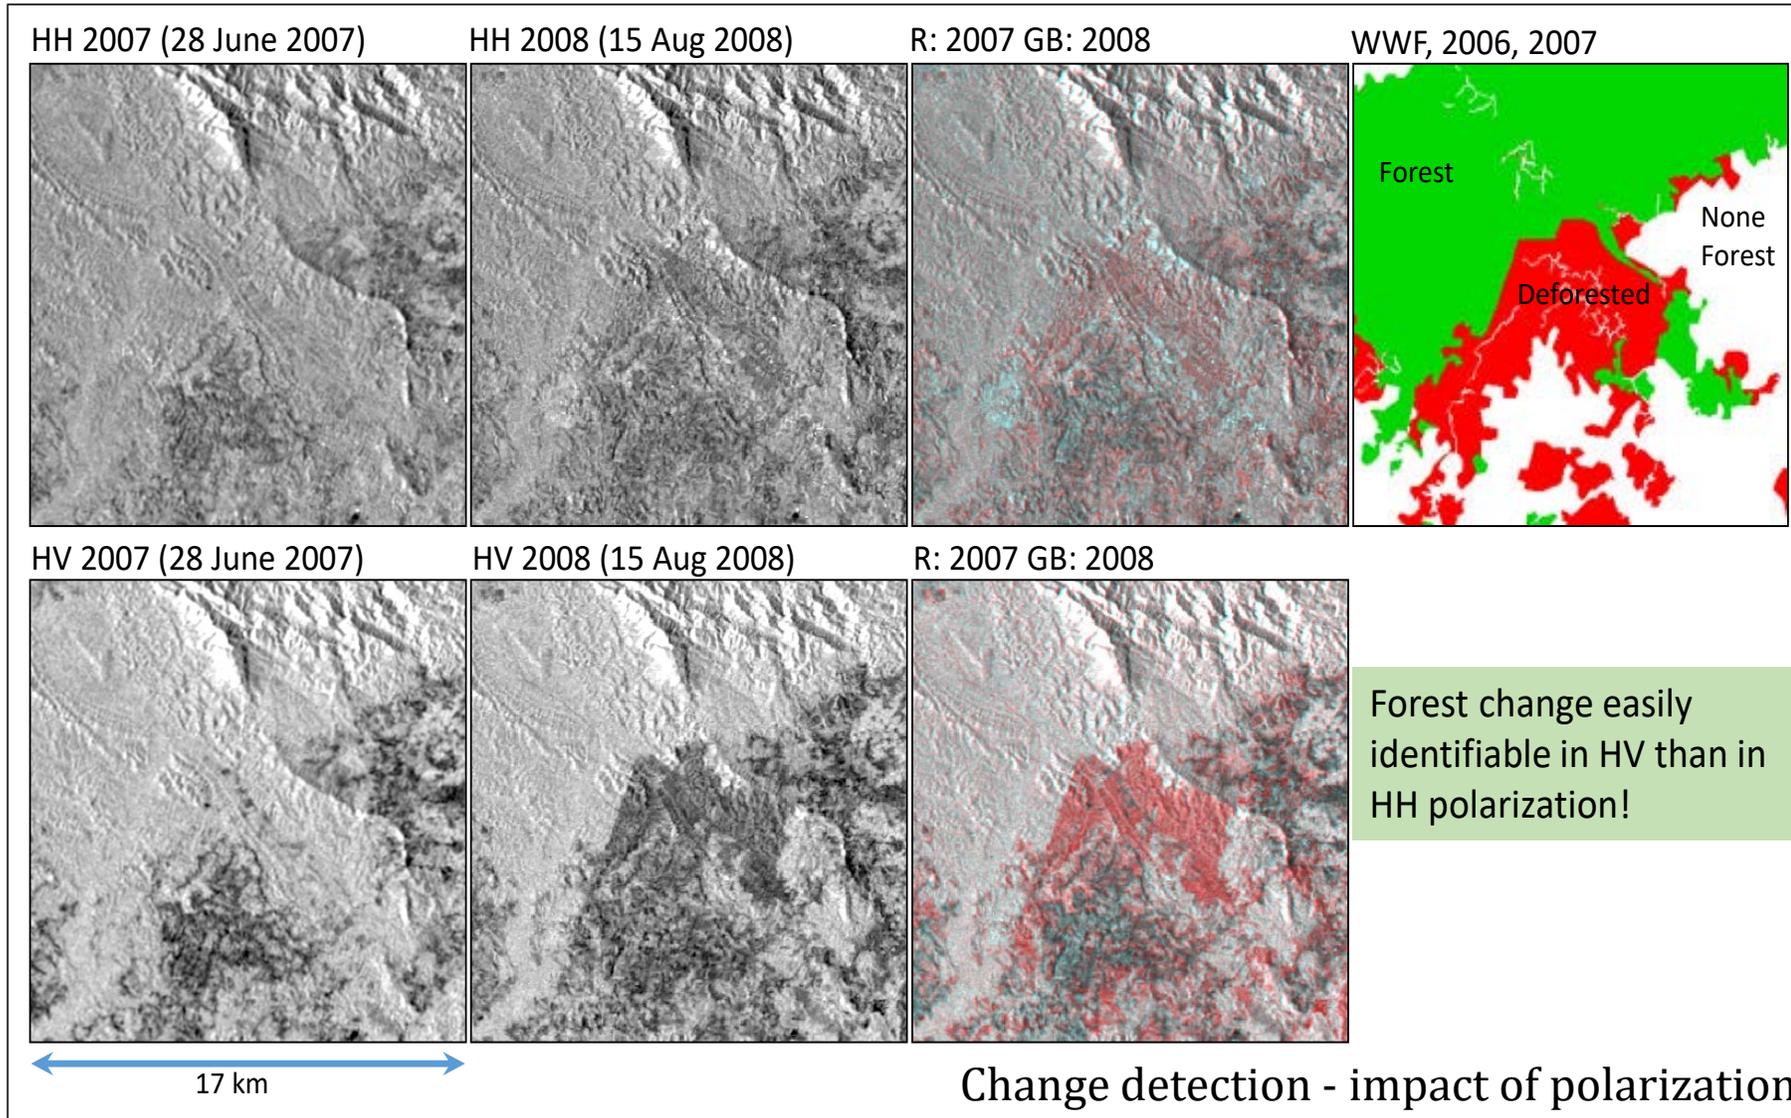

Polarizations and Applications

HH is sensitive to flooded forest, logged with trunks remaining, mangrove degradation while HV is sensitive to forest/non-forest contrast, vegetation structure, and biomass.

HH polarization (left) and HV polarization (right). Image source: ALOS PALSAR

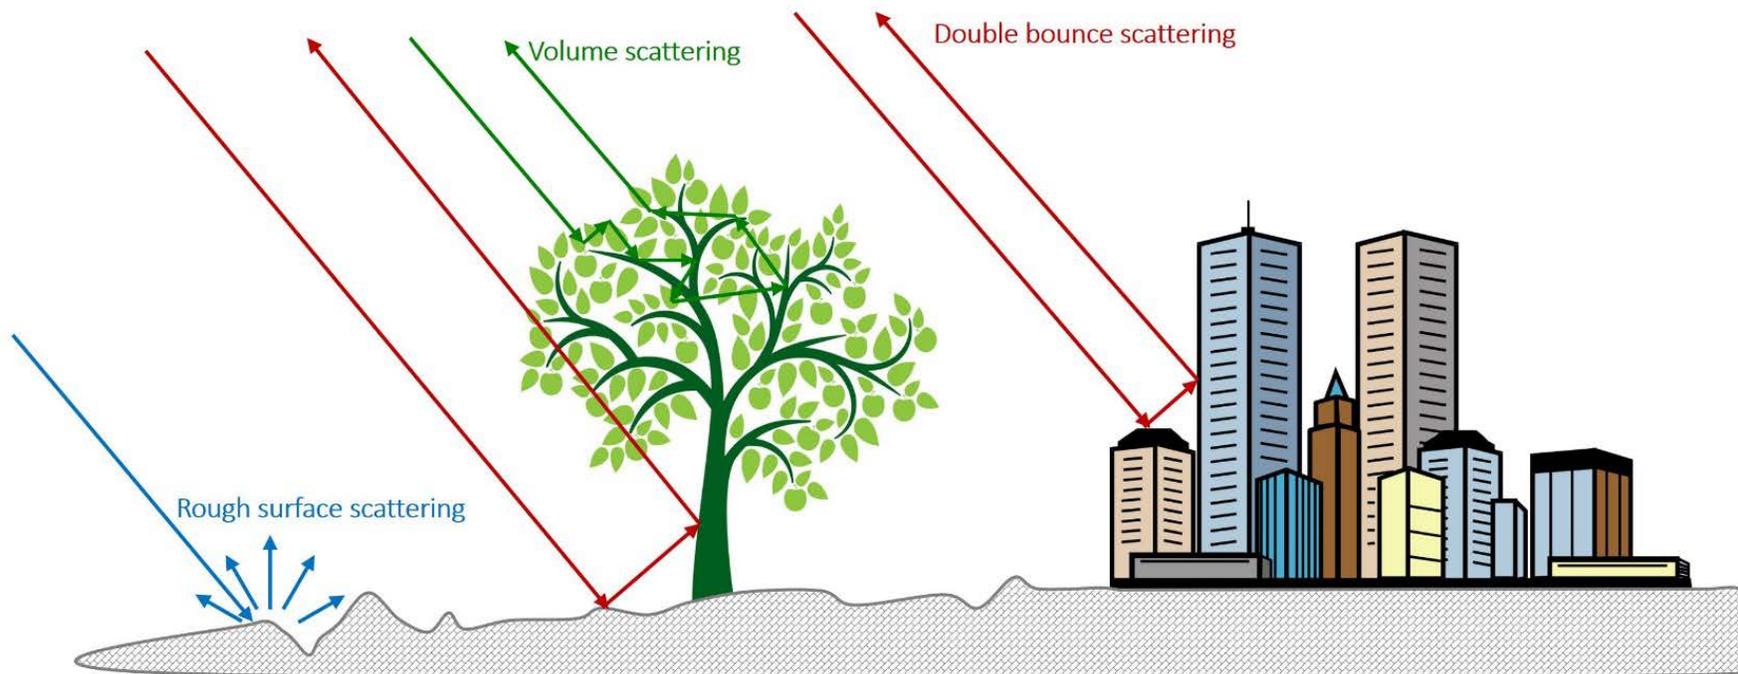

Polarizations and Applications

Depending on the transmitting and receiving polarizations, the radiation interacts with object and get backscatters differently. Both wavelength and polarization affect how a radar images the surface

Scattering Mechanisms

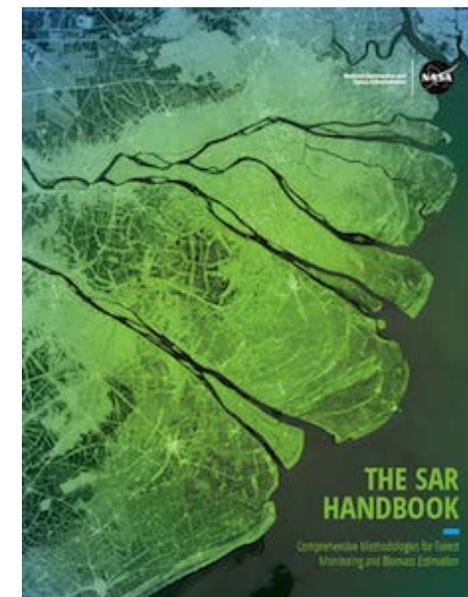

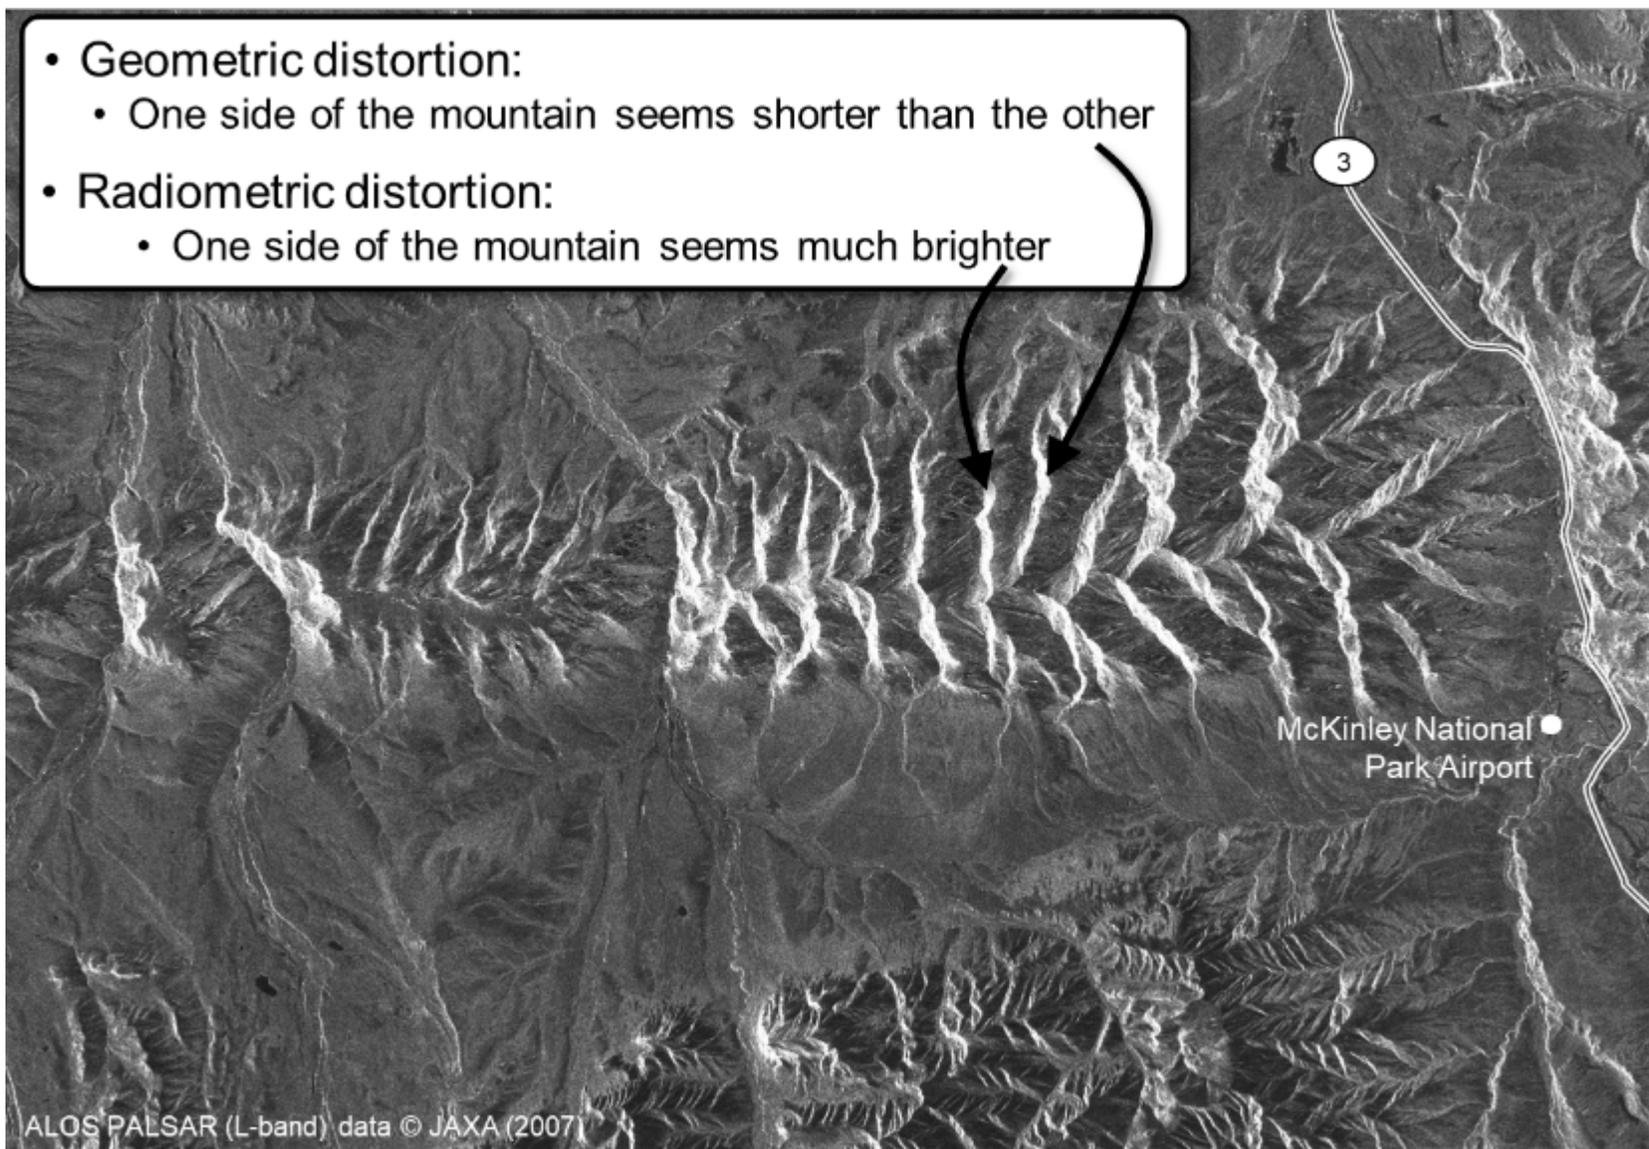

- Three main scattering mechanisms dominate:
 - **Surface scattering:** Water, bare soils, roads – scattering strongly dependent on surface roughness and sensor wavelength
 - **Double-bounce scattering:** Buildings, tree trunks, light poles – little wavelength dependence
 - **Volume Scattering:** Vegetation; dry soils with high penetration – strongly dependent on sensor wavelength and dielectric properties of medium

- At Radar wavelength, scattering is very physical and can be described as a series of bounces on scattering interfaces

Distortions

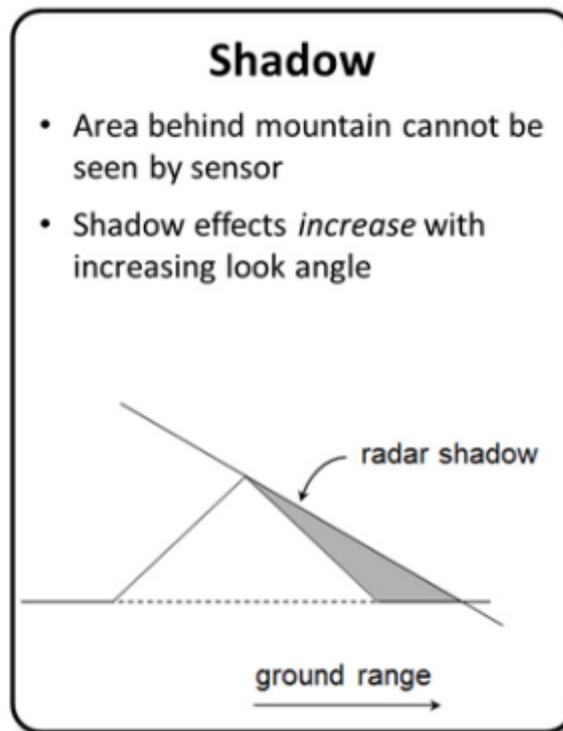

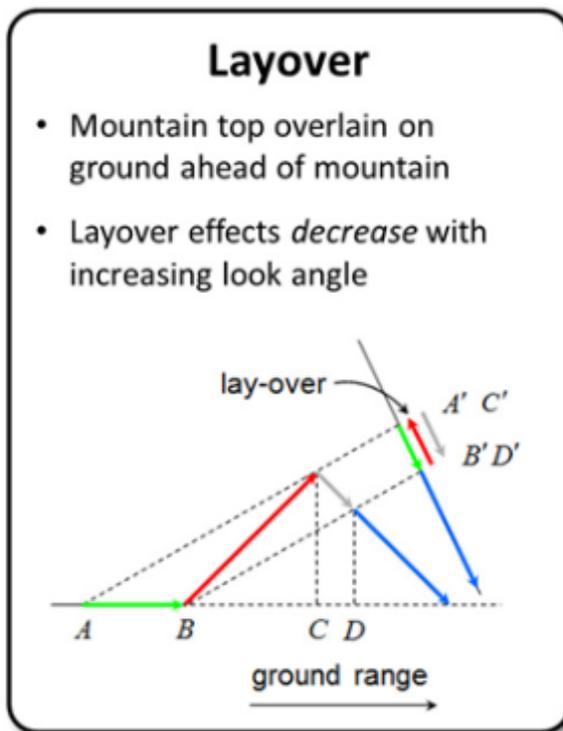

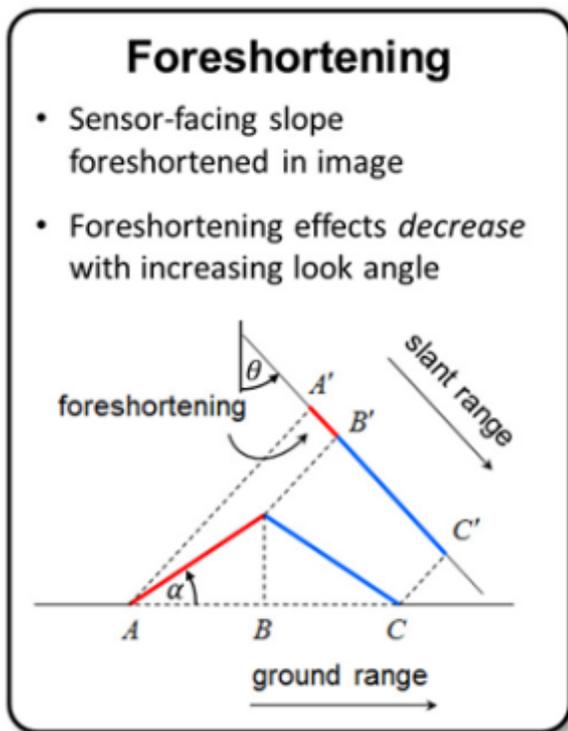

- Geometric distortion:
 - One side of the mountain seems shorter than the other
- Radiometric distortion:
 - One side of the mountain seems much brighter

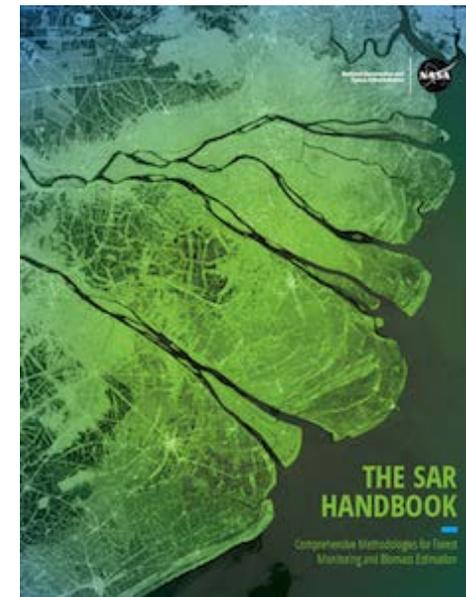

Source: *The SAR Handbook*
2019

Distortions – Geometric

Main geometric distortions on SAR images with their dependence on acquisition geometry.

(Chapter 2. F. Meyer)

Source: *The SAR Handbook* 2019

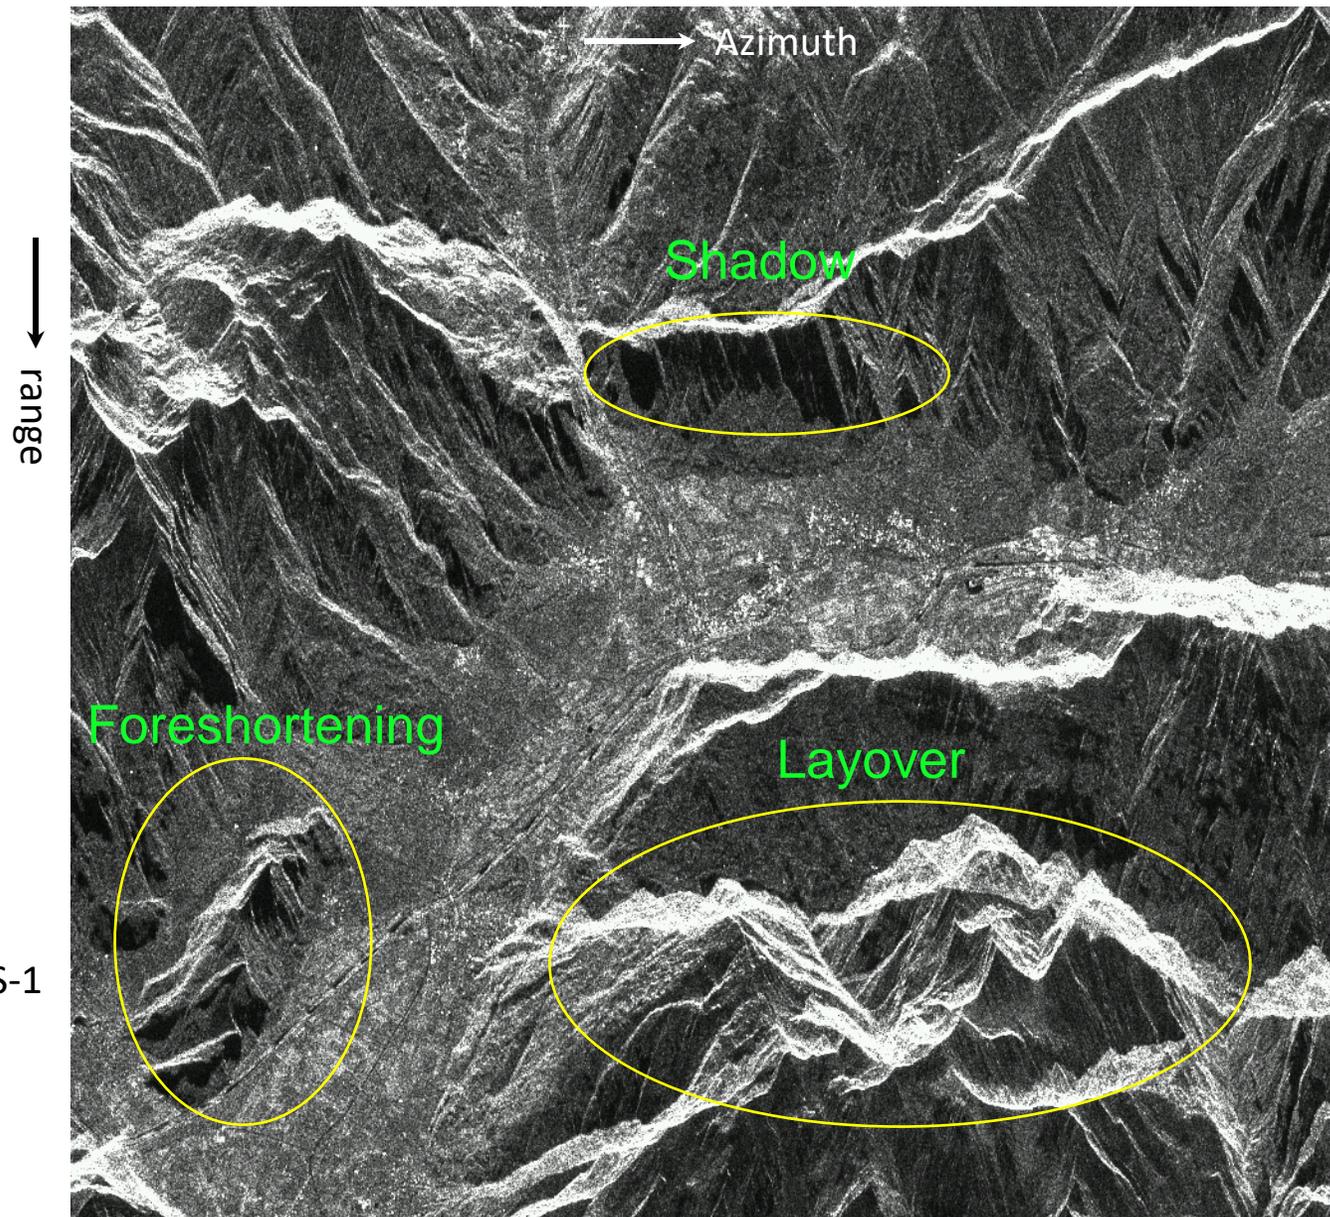

Distortions – Geometric

Foreshortening occurs when the radar beam reaches the base of a tall feature tilted away from the radar before it reaches the top. Small incidence angle produces large influence from this distortion. The foreshortened slopes appear as bright features on the image.

Layover occurs when the radar beam reaches the top of a tall feature before it reaches the base. This effect on a radar image looks similar to that due to the foreshortening. Small incidence angle also produces large influence from this distortion.

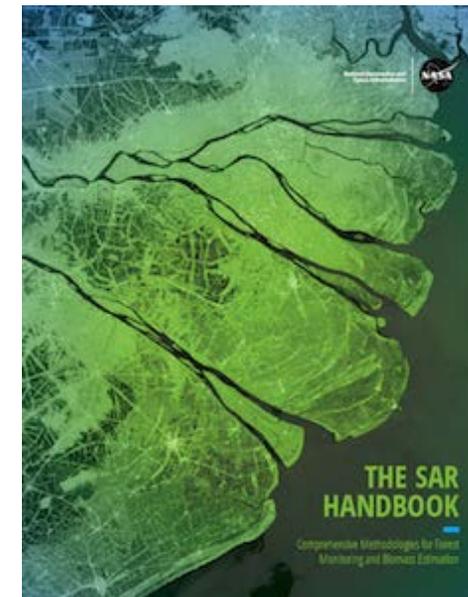

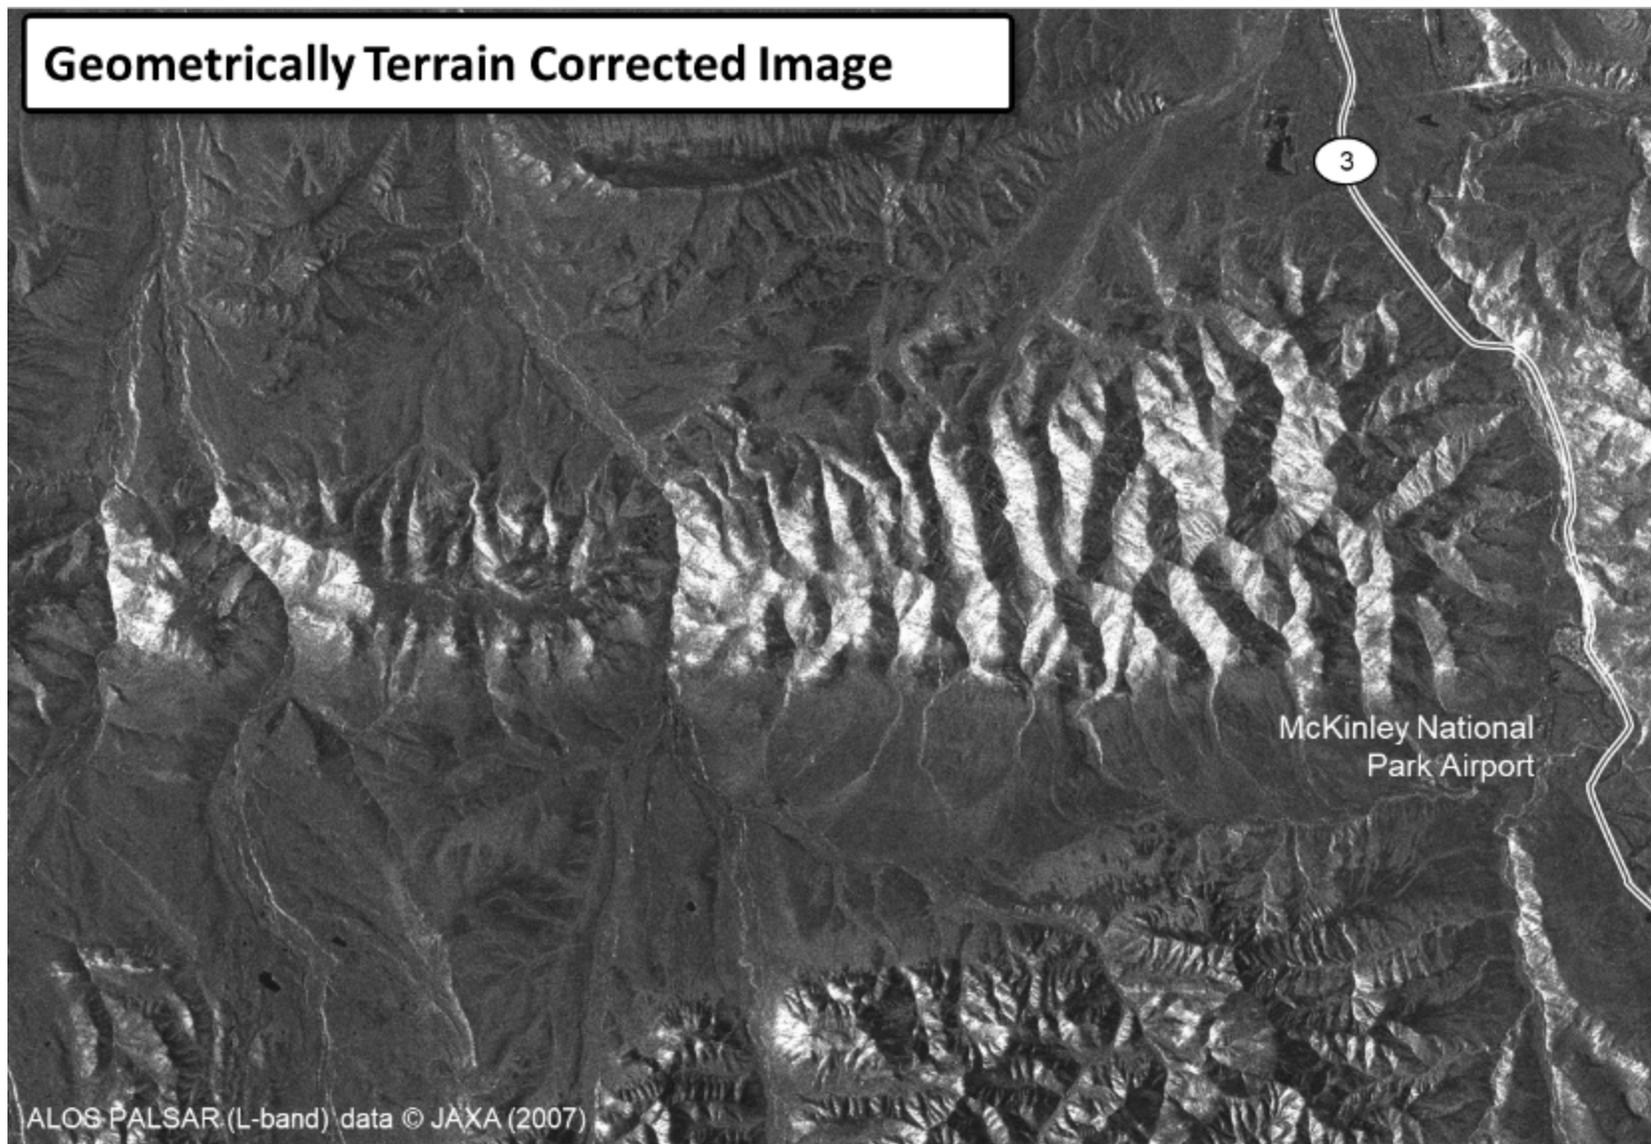

Shadow occurs when the radar beam is not able to illuminate the ground surface behind tall features or slopes. Large incidence angle produces large shadowed area.

SAR data © AeroSensing GmbH

Speckle Filtered
Bayesian Algorithm

Distortions – Radiometric

- Noise caused “Speckle” which is an inherent property of all coherent imaging systems
- Technically, it looks noise but it is not, it is an interference pattern

(The SAR Handbook, Chapter 2. F. Meyer)

Remote Sensing Applications

There are so many applications of remote sensing...

- Urban monitoring
- Water resources monitoring
- Weather and climate services
- Agriculture and food security
- Land use land cover, and ecosystem
- Disaster monitoring, emergency response, and management
- Topographic mapping
- Forest monitoring
- Measuring motion of the Earth's surface to understand earthquakes and volcanoes and support emergency management efforts.
- Studying the movements and changing size of glaciers and icecaps to explain long-term climate variability.
- Assessing geology, geophysical structure, and terrain for the likelihood of finding oil, gas or other natural resources.
- Monitoring of oil spills, etc.

SAR Handbook: Comprehensive Methodologies for Forest Monitoring and Biomass Estimation

Editors: Africa F. Anderson, Kelsey E. Herndon, Rajesh B. Thapa, Emil Cherrington

- ▶ Freely-available eBook, interactive pdfs, and training modules; result of a 2-year joint collaboration between NASA SERVIR & SilvaCarbon
- ▶ Applied content, hands-on trainings to get started using Synthetic Aperture Radar (SAR) for forest monitoring, biomass estimation, mangrove extent, time-series analysis
- ▶ Authored by world-renowned SAR experts from the NISAR Science Team, US Forest Service, academia
- ▶ Reviewed and tested by the SERVIR-Global network
- ▶ Downloadable open-source scripts and sample datasets for a variety of forestry applications; useful for beginners to experts

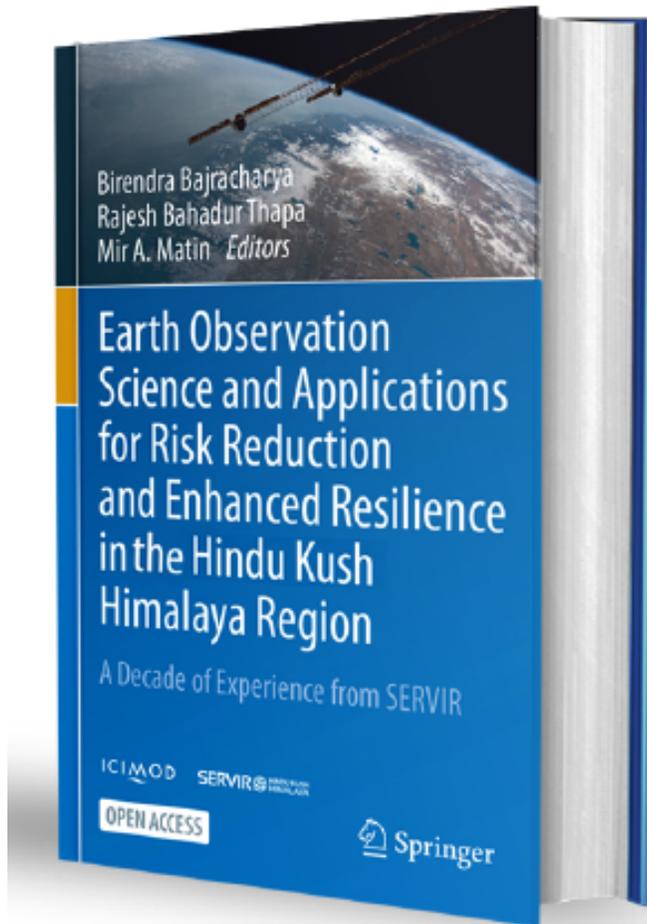

Download the SAR Handbook here: <https://bit.ly/2UHZtaw>

Earth Observation Science and Applications for Risk Reduction and Enhanced Resilience in the Hindu Kush Himalaya region

A Decade of Experience from SERVIR

This open access book is a consolidation of lessons learnt and experiences gathered from our efforts to utilize Earth observation (EO) science and applications to address environmental challenges in the Hindu Kush Himalaya region. It includes a complete package of knowledge on service life cycles including multi-disciplinary topics and practically tested applications for the HKH. It comprises 19 chapters drawing from a decade's worth of experience gleaned over the course of our implementation of SERVIR-HKH – a joint initiative of NASA, USAID, and ICIMOD – to build capacity on using EO and geospatial technology for effective decision making in the region.
