

CASCADING IMPACTS

How Can We Adapt and Reduce Risk in the Mountains and Downstream?

8 November 2022

13:00-14:30 // Cryosphere Pavilion

This event, organized by the Adaptation at Altitude consortium, focuses on the impacts and risks from climate hazards in mountains, which have cascading and compounding detrimental effects on both local and downstream ecosystems and billions of people worldwide.

Introductory inputs on the latest IPCC assessment, measures such as nature-based solutions, and experiences in responding to these risks are followed by a panel discussion on engaging scientific insights and practical knowledge with policy action in mountains. The panel is followed by a Q&A with the audience.
